

KNX S-UP

Actuator for 230 V or 24 V

Item numbers 70134, 70135

1. Description	3
1.1. Technical data	3
1.2. Structure	4
1.2.1. Structure 230 V AC version	4
1.2.2. Strucure 24 V DC version	5
2. Installation and commissioning	5
2.1. Installation notes	5
2.2. Connection	6
2.3. Notes on installation and comissioning	6
3. Transfer protocol	7
3.1. List of all communication objects	7
4. Parameter settings	10
4.1. General settings	10
4.2. Drive	10
4.3. Control	12
4.3.1. Automatic for shading	17
4.3.2. Automatic for windows	22
4.4. Scenes	26
4.5. Connection option for zero position sensor	26

Installation, inspection, commissioning and troubleshooting of the device must only be carried out by a competent electrician.

This manual is amended periodically and will be brought into line with new software releases. The change status (software version and date) can be found in the contents footer. If you have a device with a later software version, please check **www.elsner-elektronik.de** in the menu area "Service" to find out whether a more up-to-date version of the manual is available.

Clarification of signs used in this manual

Safety advice.

Safety advice for working on electrical connections, components, etc.

DANGER!

... indicates an immediately hazardous situation which will lead to death or severe injuries if it is not avoided.

WARNING!

... indicates a potentially hazardous situation which may lead to death or severe injuries if it is not avoided.

CAUTION!

... indicates a potentially hazardous situation which may lead to trivial or minor injuries if it is not avoided.

ATTENTION! ... indicates a situation which may lead to damage to property if it is not avoided.

ETS

In the ETS tables, the parameter default settings are marked by underlining.

1. Description

The **Actuator KNX S-UP** controls shadings (blinds, awnings, roller shutters) or windows. The automatic for this may be provided externally or internally. An internal automatic offers numerous options for blocking, locking (e. g. master–slave) and priority settings (e. g. manual–automatic). Scenes may be stored and recalled via the bus.

Functions:

- For drive mechanism of **shading** or **window**
KNX S-UP 230 V: For 230 V motor
KNX S-UP 24 V: For 24 V polarity changer motor
- **8 channel scene control** for operating position (for blinds also slat position)
- **Slat tracking** for blinds according to the position of the sun
- **Position memory** (operating position) with a 1 bit object (Storage and recall e. g. with push-button)
- **Position feedback** (operating position, for blinds also slat position)
- Control by **internal or external automatic**
- Setting of the priority of manual or automatic control by time or via communication object
- **Mutual locking** of two drives by means of zero position sensors avoids collisions e. g. of shading and window (master–slave)
- Blocking objects and alarm messages have different priority so that safety functions always are higher-ranking (e. g. wind blocking)

Configuration is made using the KNX software ETS. The **product file** can be downloaded from the Elsner Elektronik homepage on **www.elsner-elektronik.de** in the “Service” menu.

1.1. Technical data

Housing	Plastic material
Colour	White
Mounting	In-wall (in socket Ø 60 mm, 60 mm deep)
Protection category	IP 20
Dimensions	approx. 50 x 51 x 41 (W x H x D, mm)
Weight	230 V version: approx. 90 g 24 V version: approx. 70 g
Ambient temperature	Operation -20...+70°C, storage -30...+85°C
Ambient air humidity	5...80% R. H., avoid condensation
Operating voltage	Available for 230 V AC or for 24 V DC
Current	At the bus: 10 mA At 24 V DC: 40 mA At 230 V AC: 2 mA AC

Output	1 x Drive mechanism 230 V version: max. 500 W, fused with microfuse T6.3 A 24 V version: max. 50 W
Max. cable length binary inputs	50 m
Data output	KNX +/- bus terminal plug
BCU type	Own micro controller
PEI type	0
Group addresses	max. 200
Allocations	max. 200
Communication objects	72

The product conforms with the provisions of EU directives.

1.2. Structure

1.2.1. Structure 230 V AC version

2. Installation and commissioning

2.1. Installation notes

Installation, testing, operational start-up and troubleshooting should only be performed by an electrician.

DANGER!

Risk to life from live voltage (mains voltage)!

There are unprotected live components within the device.

- VDE regulations and national regulations are to be followed.
- Ensure that all lines to be assembled are free of voltage and take precautions against accidental switching on.
- Do not use the device if it is damaged.
- Take the device or system out of service and secure it against unintentional use, if it can be assumed, that risk-free operation is no longer guaranteed.

The device is only to be used for its intended purpose. Any improper modification or failure to follow the operating instructions voids any and all warranty and guarantee claims.

After unpacking the device, check it immediately for possible mechanical damage. If it has been damaged in transport, inform the supplier immediately.

The device may only be used as a fixed-site installation; that means only when assembled and after conclusion of all installation and operational start-up tasks and only in the surroundings designated for it.

Elsner Elektronik is not liable for any changes in norms and standards which may occur after publication of these operating instructions.

2.2. Connection

The actuators are installed in a flush-type socket. The connection is accomplished by a KNX connection clamp at the KNX data bus. Furthermore, a voltage supply (230 V AC or 24 V DC, depending on the version) is necessary. The physical address is allocated by the KNX software. For this purpose, the actuator is provided with a programming key with control LED.

2.3. Notes on installation and commissioning

Never expose actuators to water (rain) or dust. This might damage the electronic system. A relative air humidity of 80% must not be exceeded. Avoid bedewing.

After the auxiliary voltage has been applied, the device will enter an initialisation phase lasting a few seconds. During this phase no information can be received or sent via the bus.

For KNX devices with safety functions (e.g. wind or rain blocks), it is important to establish periodical monitoring of the safety objects. The optimal ratio is 1:3 (example: if the weather station sends a value every 5 minutes, the actuator must be configured for a monitoring period of 15 minutes).

3. Transfer protocol

3.1. List of all communication objects

Abbreviations flags:

K Communication

L Read

4. Parameter settings

The default settings of the parameter are labeled by an underscore.

4.1. General settings

Actuator controls	Shutter • blinds • awning • window
Use scenes (see chapter <i>Scenes</i> , page 26)	<u>No</u> • Yes
Send delay of threshold value after voltage returns	<u>5 s</u> ... 2 h
Send delay of switching and status outputs after voltage returns	<u>5 s</u> ... 2 h

4.2. Drive

First set the general specifications for the drive.

Driving direction:

Up/down, on/off or open/close can be exchanged.

Exchange UP/DOWN (<i>shutter, blinds</i>)	<u>no</u> • yes
Exchange ON/OFF (<i>awning</i>)	
Exchange OPEN/CLOSE (<i>window</i>)	

Runtime:

The runtime between the end positions is the basis for moving into intermediate positions (e.g. for movement range limits and scenes).

Runtime DOWN in sec (<i>shutter, blinds</i>) Runtime OFF in sec (<i>awning</i>) Runtime UP in sec (<i>window</i>)	1 ... 320; <u>60</u>
Runtime OPEN in sec (<i>shutter, blinds</i>) Runtime ON in sec (<i>awning</i>) Runtime CLOSE in sec (<i>window</i>)	1 ... 320; <u>65</u>

Runtime zero position and step setting of slats:

(only for shutters)

Through the runtime in which the drive continues moving in the zero position (i.e. after reaching the top end position), different curtain lengths or assembly positions of the end position switch may be balanced. The shading of a facade is completely retracted by adjusting the zero position runtimes, and thus provides a better overall image.

Step time x step number determines the turning time of the slats.

Runtime zero position in 0.1 sec	<u>0</u> ... 255
Step time in 10 ms	1 ... 100; <u>20</u>
Step number slats	1 ... 255; <u>5</u>

Break time:

The required break times during a change of direction of the drive should be adjusted according to the specifications of the motor manufacturer.

Break time for a change of direction in 0.1 sec	5 ... 100; <u>10</u>
---	----------------------

Reference movement:

With the regular movement to the two end positions, the runtime and zero position are adjusted again. Here it will be adjusted after how many movements before a positioning movement a reference movement will be completed. The reference movement is always in the direction of the secure position (retracting when shading, closing windows).

Perform a reference movement	<u>no</u> • yes
Perform a reference movement	yes
for more than movements before an auto positioning movement	1 ... 255; <u>10</u>

Slat turning:*(only for shutters)*

The slat turning should be adjusted according to the specifications of the motor manufacturer.

Turn slats	<ul style="list-style-type: none"> • <u>never</u> • only after positioning movement • after each movement
------------	--

Drive position:

The current position can be sent to the bus. The adjustable delay ensures that for a longer drive not too many data packages block the bus.

Send drive position after change	<u>no</u> • yes
Send drive position after change	yes
Sending delay of position in 0.1 sec	0...50; <u>10</u>

4.3. Control

Set the behavior of the drive here.

Movement range limit:

The operating range limit is used in order to avoid that two units collide with each other (e.g. an awning and a window which is about to open).

One of two drive mechanisms is prioritised and is parameterised as master and the other one as slave. By means of zero position sensors, both actuators know the own current status and the current status of the other one. This one is either “in a safe position” or “not in a safe position”. The safe position is reached as soon as the drive mechanism is in a sector where a collision is not possible (for an awning, for example, this might be an extension of 0 to 30%). In order to report the safe position of the drive mechanism, either a zero position sensor (e.g. final position switch or light barrier) may be connected at an input of the actuator, or the actuator receives the message of its zero position sensor by the bus (see graphic in chapter *Connection options for zero position sensors* in the general part).

Before the drive mechanism of the master actuator is moved, the slave actuator receives the command to move its drive mechanism to the safe position. As a consequence, the slave remains in safe position or it moves back if it is not within the safe range.

The master actuator knows from the communication object „Slave zero position status” whether the drive mechanism connected to the slave actuator is already in a safe position (then the master moves immediately) or not (then the master waits). Only if the master actuator is informed that the slave drive mechanism is in a safe position, it moves its drive mechanism beyond its own safe position.

Example:

The ventilation with the window shall take priority over the shading with the awning. Therefore, the window is parameterised as master, the awning as slave. Both are provided with a zero position sensor which reports whether the drive mechanism is in a safe position or not.

The awning is now extended and the window shall be opened. The window knows the status of the awning ("not safe position") and therefore submits a master command to the awning. This is the signal for the awning, to retract a little bit. As soon as the awning has reached a safe position, there is an according feedback signal of the zero position sensor of the awning. Only now the window opens.

Master and slave regularly exchange their positions ("safe" or "not safe"). By means of the monitoring period, you may adjust the frequency of information retrieval. The selected period should be shorter than the period which the monitored drive mechanism needs to travel from the limit of the safe range (last reported safe position) to a position where there is risk of collision.

If the drive mechanism does not receive a master/slave or zero position object, it moves to the safe position. The same holds true for a bus voltage breakdown or for a malfunction message from the zero position sensor (is valid for the parameterisation as master and as slave).

Without movement range limitation:

Use movement range limit	no
Behavior for bus voltage failure	<ul style="list-style-type: none"> • <u>no action</u> • stop • Up-command • Down-command

With movement range limit:

If not obtaining a master/slave status or zero position object and for bus voltage failures the drive will move into a safe position.

Use movement range limit	yes
Actuator is	<u>Master</u> • Slave

Actuator as master:

Actuator is	Master
Send repetition for master command in sec	1 ... 255; <u>10</u>
Monitoring period for zero position object and slave status in sec	1 ... 255; <u>10</u>

Actuator as slave:

Actuator is	Slave
Send repetition for slave commands in sec	1 ... 255; <u>10</u>
Monitoring period for zero position object and master status in sec	1 ... 255; <u>10</u>

Movement position for slave in % if input "Master zero position command" = 1	<u>0</u> ... 100
--	------------------

Monitoring of alarm and blocking objects:

Monitoring of alarm and blocking objects use	<u>No</u> • Yes
Monitoring of alarm and blocking objects use	Yes
Monitoring period for alarm/blocking objects	5s ... 2h; <u>5 min</u>
Behavior if not obtaining an alarm/blocking object	<u>Stop</u> • Up command • Down command <i>(for shutter/blinds)</i> <u>Stop</u> • Retract command • Extend command <i>(for awning)</i> <u>Stop</u> • Close command • Open command <i>(for window)</i>

The priorities of the blocking objects correspond to the sequence listed (alarm object has the highest priority, the rain blocking the lowest). Block alarm and blocking object at 1.

Alarm object:

For the alarm object it is specified what happens for object value 1 and 0. This way for example a fire alarm scenario can be configured (creating escape routes by retracting the shading, smoke extraction via windows).

Use alarm object	Yes
Use alarm object	<u>No</u> • Yes
If alarm object has value =1	<ul style="list-style-type: none"> • no action • stop • <u>Up-command</u> • Down-command <i>(shutter/blinds)</i> • <u>Retract-command</u> • Extend-command <i>(awning)</i> • <u>Close-command</u> • Open-command <i>(window)</i>
If alarm object has value =0	
For manual operation before and after alarm	<ul style="list-style-type: none"> • <u>no action</u> • move into last position
For automatic operation after alarm	follow automatic
Value of object before 1st communication and bus voltage return	0... <u>1</u>

Blocking object 1/2:

For the blocking object it is specified what happens for object value 1 and 0. This can for example prevent being locked out on the patio (opened window contact of the patio door blocks the shutter in front of the door).

Use blocking object	Yes
Use blocking object	<u>No</u> • Yes
If blocking object has value =1	<ul style="list-style-type: none"> • no action • stop • <u>Up-command</u> • Down-command (shutter/blinds) • <u>Retract-command</u> • Extend-command (awning) • <u>Close-command</u> • Open-command (window)
If blocking object has value =0	
For manual operation before and after blocking	<ul style="list-style-type: none"> • <u>no action</u> • move into last position
For automatic operation after blocking	follow automatic
Value of object before 1st communication and bus voltage return	0... <u>1</u>

Wind blocking:

The input object "wind blocking" is linked with the output object of a wind sensor. The input can be a 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value).

When blocking the shutter moves up / the awning retracts / the window closes.

Use wind blocking	Yes
Type of input object	<u>1 bit</u> • 16 bit
As of wind speed in m/s blocking (only for 16 bit input object)	2...30; <u>5</u>
Waiting period in secure position in min after wind blocking	1...255; <u>5</u>
Behavior after waiting period	
For manual operation before and after blocking	<ul style="list-style-type: none"> • <u>no action</u> • move into last position
For automatic operation after blocking	follow automatic
Send current blocking status (only for 16 bit input object)	<u>no</u> • yes

Priority rain blocking or manual operation:

Priority is	<u>rain before manual</u> • manual before rain
-------------	--

Rain blocking:

The input object "rain blocking" is linked with the output object of a rain sensor.

When blocking the shutter moves up / the awning retracts / the window closes.

Use rain blocking	Yes
Waiting period in secure position in min after rain blocking	1...20; <u>5</u>
Behavior after waiting period	
For manual operation before and after blocking	<ul style="list-style-type: none"> • <u>no action</u> • move into last position
For automatic operation after blocking	follow automatic

Automatic reset:

With the manual operation the automatic of the drive is deactivated. Here it is set when the automatic is reactivated.

Manual switches to automatic after	<ul style="list-style-type: none"> • <u>expiration of a waiting period</u> • receiving an object • expiration of a waiting period or receipt of an object
Waiting period in min (if "Expiration of a waiting period" was chosen)	1...255; <u>20</u>
Switch to automatic for an object value (if "Receipt of an object" was chosen)	0 • <u>1</u> • 0 or 1

Automatic blocking object:

With the automatic blocking object, the automatic can be deactivated for a short term (e.g. if present or during speeches in conference rooms).

Here it is also specified in which mode the actuator is found when the voltage returns, i.e. after a power failure. The mode (manual or automatic) is send as a status object to the bus.

Use automatic blocking object	<u>no</u> • yes
Operating mode after voltage returns	<ul style="list-style-type: none"> • <u>Automatic</u> • Manual
Send status object	<ul style="list-style-type: none"> • <u>1 for automatic</u> 0 for manual • 0 for automatic 1 for manual
Send delay of the status output Automatic or manual in 0.1 sec	<u>0</u> ...50

Type of automatic:

The automatic for the connected drive can be specified externally, however all the setting can also be configured internally. If "internal automatic" is chosen, a separate

menu item "Automatic" (see chapter Automatic for Shading or Automatic for Windows) appears.

Type of automatic	<u>external automatic</u> • internal automatic
-------------------	--

4.3.1. Automatic for shading

The menu item "Automatic" only appears if internal automatic is selected for "Control". The internal automatic functions take into account the brightness/position of the sun, outdoor and indoor temperature and allow a time and dimming control. A shading position can be specified or taught.

To be able to fully utilize the internal shading automation, information about brightness/twilight, outdoor and indoor temperature, time and position of the sun must be present in the bus system (e.g. data from the Elsner weather stations Suntracer KNX or Suntracer KNX-GPS).

Outdoor temperature block:

The input object "outdoor temperature block" is linked with the output object of a temperature sensor. The input object can be a 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value).

Use automatic blocking object	<u>no</u> • yes
-------------------------------	-----------------

Use automatic blocking object	yes
Type of temperature input object	<u>1 bit</u> • 16 bit

1 bit input object:

Type of temperature input object	1 bit
----------------------------------	--------------

Shading is allowed if the bit is 0 and blocked if the bit is 1.

16bit input object:

Type of temperature input object	16bit
Threshold value in 0.1°C	-300 ... 800; <u>50</u>
Hysteresis in 0.1°C	1 ... 100; <u>20</u>
Send current blocking status	<u>no</u> • yes

Shading is allowed if the measurement value is larger than the threshold value+hysteresis and blocked if the measurement value is smaller than the threshold value.

Twilight/time control:

The time control is provided via a communication object. The input object "twilight control" is linked with the output object of a brightness sensor. A 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value) can be used for the twilight control.

Use twilight/time control	<ul style="list-style-type: none"> • <u>no</u> • only twilight control • only time control • both (OR linking)
---------------------------	--

Use twilight/time control	only twilight control / both
Type of twilight object	<u>1 bit</u> • 16 bit

16bit input object:

Type of twilight object	16bit
Twilight threshold value in lux	1 ... 1000; <u>10</u>
Switching delay	1 minute
Send current twilight status	<u>no</u> • yes

Indoor temperature release:

The input object "indoor temperature release" is linked with the output object of a temperature sensor. The input object can be a 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value or target and actual value).

Use inside temperature release	<u>no</u> • yes
--------------------------------	-----------------

Type of input object	<u>1 bit</u> • 16 bit • 16bit target/actual temperature
----------------------	---

16bit input object:

Type of input object	16bit
Threshold value in 0.1°C	-300 ... 800; <u>200</u>
Hysteresis in 0.1°C	1 ... 100; <u>20</u>
Send current blocking status	<u>no</u> • yes

Shading is allowed if the measurement value is greater or equal to the threshold value and blocked if the measurement value is smaller than the hysteresis threshold value.

16bit input object (target/actual temperature):

For this function the target value and actual value (measurement value) are imported from the 16bit object and evaluated.

Type of input object	16bit target/actual temperature
Target value (SW) – actual value (MW) Difference in 0.1°C	1 ... 100; <u>20</u>
Hysteresis in 0.1°C	1 ... 100; <u>20</u>
Send current blocking status	<u>no</u> • yes

Shading is allowed if the measurement value is greater than or equal to the target value difference

and blocked if the measurement value is smaller than the target value + difference of hysteresis.

Automatic shading:

The automatic shading evaluates the input objects "brightness" and "position of the sun" of a weather station. The moving position for the automatic shading is specified here as well.

Use automatic shading	<u>no</u> • yes
-----------------------	-----------------

Brightness:

For controlling brightness, a 1bit object (smaller or larger than a threshold value), as well as two or three 16bit objects (measurement values, e.g. East, South and West sun) can be used.

Type of shading input	<u>1 x 1 bit</u> • 1 x 16 bit • 2 x 16 bit • 3 x 16 bit
-----------------------	---

1 x 1 bit input object:

Set the delay times for shading (prevents constant opening and closing when light conditions change quickly).

Type of shading input	1 x 1 bit
Drive up delay in min	0 ... 255; <u>12</u>
Departure delay in min	0 ... 30; <u>1</u>

1 x 16 bit, 2 x 16 bit or 3 x 16 bit as an input object:

The brightness threshold value can be specified per parameter or communication object. For several brightness measurement values (2 x 16 bit or 3 x 16 bit) only the maximum brightness value is compared to the threshold value.

Type of shading input	1 x 16 bit • 2 x 16 bit • 3 x 16 bit
Shading threshold specification per	<u>parameter</u> • communication object

Threshold value per parameter:

Set the threshold value and delay times for shading (prevents constant opening and closing when light conditions change quickly).

Shading threshold specification per	Parameter
Shading threshold value in klux	0 ... 100; <u>30</u>
Drive up delay in min	0 ... 255; <u>12</u>
Drive down delay in min	0 ... 30; <u>1</u>
Send current shading status	<u>No</u> • Yes

Threshold value per communication object:

The threshold value is received via the communication object and can be changed additionally (e.g. button for "more sensitive" and "less sensitive"). Set the delay times

for shading here (prevents constant opening and closing when light conditions change quickly).

Shading threshold specification per	communication object
The value communicated last shall be retained	<ul style="list-style-type: none"> • <u>not</u> • after voltage returns • after voltage returns and programming
Start threshold value in klux valid until 1st communication	0 ... 100; <u>30</u>
Type of limit value change	<ul style="list-style-type: none"> • <u>Absolute value with a 16bit comm. object</u> • Lifting/lowering with a comm. object • Lifting/lowering with two comm. objects
Increments in klux (only when "lifting/lowering with comm. object")	1 ... 5; <u>2</u>
Drive up delay in min	0 ... 255; <u>12</u>
Drive down delay in min	0 ... 30; <u>1</u>
Send current shading status	<u>no</u> • yes

Position of the sun:

Assess position of the sun	<u>no</u> • yes
Assess position of the sun	yes
Position of the sun is defined via	<ul style="list-style-type: none"> • <u>Discreet value of azimuth and elevation</u> • Directions (regarding azimuth and elevation)

Defining position of sun via values:

Enter the range (direction and height) in which the sun must be located for the shading to be active.

Position of the sun is defined via	discreet value of azimuth and elevation
Azimuth from	<u>0</u> ... 360
Azimuth to	<u>0</u> ... 360
Elevation from	<u>0</u> ... 90
Elevation to	<u>0</u> ... 90

Defining position of the sun via directions:

Enter the direction in which the sun must be positioned so that the shading is active.

Position of the sun is defined via	directions (regarding azimuth and elevation)
Directions	<ul style="list-style-type: none"> • East (azimuth: 0° ... 180°) • South east (azimuth: 45° ... 225°) • <u>South</u> (azimuth: 90° ... 270°) • South west (azimuth: 135° ... 315°) • West (azimuth: 180° ... 360°)

Slats and moving position (for shutters):

For shutters the angle of the slats can be firmly set, or the slats can automatically follow the elevation. This rule applies: Slats are closed at 100%, horizontal at 50%.

Should the slats follow the elevation	<u>no</u> • yes
---------------------------------------	-----------------

The slats should **not** follow the elevation (fixed reversing angle):

Adjust the desired position of the slats and the curtain.

Should the slats follow the elevation	no
Slat position in %	0 ... 100; <u>75</u>
Shutter position in %	0 ... 100; <u>75</u>
Use teaching object for new shading position (curtain and slat positions will be saved, see info below)	<u>no</u> • yes

The slats shall follow the elevation:

Three different elevation ranges can be set. A fixed curtain and slat position is specified for each.

Should the slats follow the elevation	yes
For an elevation less than (in degrees)	0 ... 90; <u>10</u>
Slat position in %	0 ... 100; <u>95</u>
otherwise Slat position in %	0 ... 100
Shutter position in %	0 ... 100
Use teaching object for new shading position (only the curtain position will be saved, see info below)	<u>no</u> • yes

Moving position (for awnings and blinds):

Awning position in % or blind position in %	0 ... 100; <u>75</u>
Use teaching object for new shading position	<u>no</u> • yes

Use teaching object for new shading position: The curtain position it can be specified numerically or taught manually. For teaching set "use teaching object: Yes" and the "channel X shading position teaching object" is used for saving the position reached. Saving occurs for value = 1 and can for example be realized via a button linked to the teaching object. Numerical specifications already set are overwritten by the teaching object.

4.3.2. Automatic for windows

The menu item "Automatic" only appears if internal automatic is selected for "Control". Depending on the setting, the internal automatic functions take the outdoor temperature, indoor temperature and room air humidity into account, and allow forced ventilation via a communication object.

In order to fully utilize the internal ventilation automatic, information about the outdoor and indoor temperature and the inside air humidity must be present in the bus system.

Cold supply air lock:

The input object "cold supply air block" is linked with the output object of a temperature sensor. The input object can be a 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value).

Use cold supply air block	<u>no</u> • yes
Use cold supply air block	yes
Type of temperature input object	<u>1 bit</u> • 16 bit

1bit input object:

Type of temperature input object	1 bit
----------------------------------	--------------

Ventilation is allowed if the bit is 0 and blocked if the bit is 1.

16bit input object:

Type of temperature input object	16 bit
Threshold value in 0.1°C	-300 ... 800; <u>50</u>
Hysteresis in 0.1°C	1 ... 100; <u>20</u>
Send current blocking status	<u>no</u> • yes

Ventilation is allowed if the measurement value is larger than the threshold value+hysteresis

and blocked if the measurement value is smaller than or equal to the threshold value.

Forced ventilation:

Use forced ventilation	<u>no</u> • yes
------------------------	-----------------

If forced ventilation is active ("use forced ventilation: Yes"), ventilation is started as soon as the communication object "forced ventilation" = 1.

Warm supply air block:

The input object "warm supply air block" is linked with the output object of one or more temperature sensors. The input object can be a 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value indoor/outdoor or target and actual value).

Use warm supply air block	<u>no</u> • yes
---------------------------	-----------------

Use warm supply air block	yes
Type of input object	1 bit • 16 bit • 16 bit target/actual temperature

1bit input object:

Type of input object	1 bit
----------------------	--------------

Ventilation is allowed if the bit is 0 and blocked if the bit is 1.

16bit input object:

Type of input object	16 bit
Threshold value in 0.1°C	-100 ... 200; <u>50</u>
Hysteresis in 0.1°C	1 ... 100; <u>20</u>
Send current blocking status	<u>no</u> • yes

Ventilation is allowed if the outdoor measurement value is smaller than the indoor measurement value+difference-hysteresis and blocked if the outdoor measurement value is greater than or equal to the indoor measurement value+difference.

16bit input object (target/actual temperature):

For this function the target value and actual value (measurement values) are imported from the 16bit object and evaluated.

Type of input object	16 bit target/actual temperature
Close if outdoor temperature exceeds the target value by (in 0.1°C)	0...255; <u>50</u>
Hysteresis in 0.1°C	1...100; <u>20</u>
Send current blocking status	<u>no</u> • yes

Ventilation is allowed if the outdoor measurement value is smaller than the target value+difference-hysteresis and blocked if the outdoor measurement value is greater than or equal to the target value+difference.

Open by temperature/humidity:

Open window	<ul style="list-style-type: none"> • <u>never</u> • if too high temperature • if too high room air humidity • if too high temperature or room air humidity
-------------	--

Indoor temperature:

These parameters appear if ventilated at "too high temperature" / "too high temperature or room air humidity". The input object can be a 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value or target and actual value).

Type of temperature input object	<u>1 bit</u> • 16 bit • 16 bit target/actual temperature
----------------------------------	--

1 bit input object:

Type of temperature input object	1 bit
----------------------------------	--------------

Ventilation is activated if the bit is 0 and blocked if the bit is 1.

16 bit input object:

The threshold value specification can be provided via a parameter or communication object.

Type of temperature input object	16 bit
Indoor temperature of threshold specification via	<u>parameter</u> • communication object

Threshold value per parameter:

Indoor temperature of threshold specification via	parameter
Indoor temperature threshold value in 0.1?	-100 ... 500; <u>300</u>
Hysteresis in 0.1?	1 ... 100; <u>20</u>
Send current temperature status	<u>no</u> • yes

Threshold value per communication object:

The threshold value is received via the communication object and can be changed additionally (e.g. button for target temperature + and -).

Indoor temperature threshold specification via	communication object
The value communicated last shall be retained	<ul style="list-style-type: none"> • <u>not</u> • after voltage returns • after voltage returns and programming
Start threshold value in 0.1°C valid until 1st communication	100 ... 500; <u>300</u>

Type of limit value change	<ul style="list-style-type: none"> • <u>Absolute value with a 16bit comm. object</u> • Lifting/lowering with a comm. object • Lifting/lowering with two comm. objects
Increments (only when "lifting/lowering with comm. object")	0.1°C ... 5°C; <u>1°C</u>
Hysteresis in 0.1?	1 ... 100; <u>20</u>
Send current temperature status	<u>no</u> • yes

16 bit input object (target/actual temperature):

For this function the target value and actual value (measurement values) are imported from the 16bit object and evaluated.

Type of temperature input object	16 bit target / actual temperature
Open if actual value exceeds the target value (in 0.1°C)	0...255; <u>20</u>
Hysteresis in 0.1°C	1...100; <u>20</u>
Send current blocking status	<u>no</u> • yes

Room air humidity:

These parameter appear if ventilated at "too high room air humidity" / "too high temperature or room air humidity". The input object can be a 1bit object (smaller or larger than a threshold value), as well as a 16bit object (measurement value).

Type of humidity input object	<u>1 bit</u> • 16 bit
-------------------------------	-----------------------

1 bit input object:

Type of humidity input object	1 bit
-------------------------------	--------------

Ventilation is activated if the bit is 0 and blocked if the bit is 1.

16 bit input object:

Type of humidity input object	16 bit
Indoor humidity threshold value in %	0 ... 100; <u>60</u>
Hysteresis in 0.1°C	1 ... 100; <u>5</u>
Send current humidity status	<u>no</u> • yes

Window opening:

If the ventilation by temperature or humidity is controlled via a 1bit input object, then enter the opening position in %.

Window opening in %	1... <u>100</u>
---------------------	-----------------

If the ventilation is controlled by temperature and humidity via a 16bit input object, then you can either set an opening position or open the windows incrementally. In the

step operation the temperature/humidity deviation is checked after a specified period of time, and may be increased/decreased by one step.

Window opening	<u>absolute in %</u> • incrementally
Window opening in % (only if "window opening is absolute in %")	1... <u>100</u>
incrementally by (in %) (only if "window opening is in increments")	1...100; <u>25</u>
every (in minutes) (only if "window opening is in increments")	1...60; <u>3</u>

4.4. Scenes

The menu item "scenes" appears only for "General settings" if "Use scenes: Yes" is selected.

You can save 8 different movement positions as scenes and call them via the bus. Additionally, you can indicate if for the programming of scenes all, or only the changed settings are transferred to the bus.

Transfer for programming	<u>all parameters</u> • only changed parameters
Use scenes	<u>no</u> • yes

You can give each activated scene a unique scene number, regardless of the internal actuator number.

Scene number	<u>0</u> ...127
Shutter position in % or blind position in % or awning position in % or window position in %	0...100; <u>50</u>
slat position in % (only for shutters)	0...100; <u>70</u>

4.5. Connection option for zero position sensor

See also section *Movement range limit* in chapter *Control*, page 12. The example and the communication object numbers refer to the mutual master-slave coupling of drives to the two actuators KNX S-UP.

**Actuator 1 is Master, zero position sensor via bus,
Actuator 2 is Slave, zero position sensor via bus:**
