| relay response dependent on parameters. |  |

Wiring diagram: Terminals:

## Hardware information:

- The device permits connection of different phase conductors.
- Relay actuation effected with the slide switches is not registered by the software. An output disabled via the bus can therefore nevertheless be controlled by hand.

*: For objects marked (L), the current object status can be read out (set L flag!).
**: With brightness value objects, the current brightness value is internally followed up. By setting the Ü flag, the brightness value can be transferred to the bus as an active value when a certain dimming level is reached.

## Object description

| 매 | 0-2 | Switching | 1 bit object for switching of the load |
| :---: | :---: | :---: | :---: |
| $\square$ | 3-5 | Dimming | 4 bit object for relative brightness change between 0 and $100 \%$ |
| $\square \square_{\text {- }}$ | 6-8 | Brightness value | 1 byte object for brightness setting between 0 and 255 |
| $\square \square^{\text {a }}$ | 9-11 | Switching checkback | 1 bit object for switching status checkback of control unit |
| $\square$ | 12-14 | Disabling | 1 bit object for disabling of the control unit |
| $\square$ | 15-17 | Light-scene extension | 1 byte object for recalling or storing of light-scenes 1-8 |

## Scope of functions

- Dimming and switching of fluorescent lamps in conjunction with an electronic ballast or other dimmable 1-10 V devices
- Switch-on and dimming behaviour adjustable by means of parameters
- Checkback of switching status possible via objects 9, 10 and 11
- Active transmission of brightness value via brightness objects possible (set Ü flag)
- "Soft-ON", "Soft-OFF" and time dimmer parameterizable
- Dimming start at predefined brightness values
- Delayed shutoff when value drops below shutoff brightness
- Light-scene operation (recalling of up to eight internally stored brightness values as light-scenes)
- Disable mode can be activated via an object with parameterizable brightness value at the beginning and end of disabling
- Response of control unit after bus voltage failure and return adjustable

| Parameter description |  |  |
| :---: | :---: | :---: |
| Description: | Values: | Remarks: |
| B Output 1 |  |  |
| Basic brightness (brightness value $=1$ ) (depending on lamp) | level 1 (control voltage approx. 0.6 V ) <br> level 2 (control voltage approx. 1.2 V) <br> level 3 (control voltage approx. 1.8 V ) <br> level 4 (control voltage approx. 2.4 V) <br> level 5 (control voltage approx. 3.0 V ) <br> level 6 (control voltage approx. 3.6 V) <br> level 7 (control voltage approx. 4.2 V ) <br> level 8 (control voltage approx. 4.8 V ) | Adaptation of basic brightness (lowest dimming level) to local conditions. Level 1 corresponds to lowest basic brightness. |
| Response on bus voltage failure |  | The response of the device in the event of bus voltage failure can be parameterized. |
|  | ON (max. brightness) | The relay is switched on. A voltage applied at the $1-10 \mathrm{~V}$ input is raised to 10 V when mains voltage is present at the electronic ballast. |
|  | OFF | The relay is switched off. The voltage at the $1-10 \mathrm{~V}$ input is not defined because the mains volttage supply to the electronic ballast is off. |
|  | no change of relay switching status | The relay is not energized and remains in its current switching state. A voltage applied at the $1-10 \mathrm{~V}$ input is raised to 10 V when mains voltage is present at the electronic ballast. |
| Response on bus voltage return | OFF basic brightness $10 \%$ $20 \%$ $30 \%$ $40 \%$ | The response of the device on return of bus voltage can be parameterized. |
|  | $\begin{aligned} & 50 \% \\ & 60 \% \end{aligned}$ | If the setting is "Brightness value at the time of bus voltage failure", the brightness at the time |
|  | 70\% | of bus voltage failure is stored in the NV |
|  | 80\% | memory of the device. The value is restored |
|  | maximum brightness | after return of bus voitage. After programming with the ETS, the value is |
|  | Brightness value on bus voltage failure | always "0" (OFF). |

| G Output 1 Disable |  |  |
| :---: | :---: | :---: |
| Function of disable object | $\begin{aligned} & 0=\text { operation, } 1=\text { disabled } \\ & 1=\text { operation, } 0=\text { disabled } \end{aligned}$ | The control unit is disabled when disable object value $=1$. <br> The control unit is disabled when disable object value $=0$. |
| Brightness at the beginning of disabling | OFF <br> basic brightness <br> 10\% <br> 20\% <br> 30\% <br> 40\% <br> 50\% <br> 60\% <br> 70\% <br> 80\% <br> 90\% <br> maximum brightness <br> no action <br> brightness value before last shutoff | Defines the brightness value active at the beginning of disable. <br> If the setting is "no action", the currently set brightness remains unchanged. <br> If the setting is "brightness value before last shutoff", the brightness value before last shutoff is stored in the device (RAM) via the switching object. This value is restored at the beginning of the disabling function. <br> Only values not equal "0" (OFF) are stored. After programming with the ETS or return of bus voltage, the value is always "1" (basic brightness). |
| Brightness at the end of disabling | OFF <br> basic brightness <br> 10\% <br> 20\% <br> 30\% <br> 40\% <br> 50\% <br> 60\% <br> 70\% <br> 80\% <br> 90\% <br> maximum brightness <br> no action <br> brightness value before last <br> shutoff <br> follow-up brightness | Defines the brightness value set at the end of disable. <br> If the setting is "no action", the currently set brightness remains unchanged. <br> If the setting is "brightness value before last shutoff", the brightness value before last shutoff is stored in the device (RAM) via the switching object. This value is restored at the end of the disabling function. <br> Only values not equal "0" (OFF) are stored. Shutting off during an active disabling function is not possible. <br> After programming with the ETS or return of bus voltage, the value is always "1" (basic brightness). <br> If the setting is "follow-up brightness", bus telegrams (switching, dimming, brightness value) will be registered also during active disable and the brightness value will be followed up. At the end of disable, the brightness value active before disable or followed up during disable will be restored. |

## Software information

- For editing of all parameters, access in der ETS must be set to "Full access".

## - Disable function (objects 12, 13 +14)

The control unit can be disabled via the bus so that the preset brightness value remains constant during an active disable. At the beginning and at the end of the disabling function, the control unit can be set to a parameterized brightness (cf. also parameter description for disabling function).

## - Control voltage

The brightness range of 0 thru 255 ( 0 thru $100 \%$ ) corresponds to a linear control voltage range. The lowest possible voltage is defined by the parameterizable basic brightness. The highest possible control voltage is fixed at approx. 10 V . The basic brightness corresponds to brightness value $=1$. When the brightness value is set $=0$ the relay of the control unit switches off the connected electronic ballast ("OFF" state). In this case, the control voltage is non defined because the mains voltage supply of the electronic ballast is off. In case of electronic ballasts connected to the control input (1-10 V) but not switched by the internal relay, i.e. the mains voltage supply of these ballasts is not switched via the control unit, the control voltage in the "OFF" state is set to the value corresponding to the basic brightness.

## - Brightness value

The currently set brightness value is followed up in the brightness value objects. If the $L$ flag of these objects is set, the current value can be read out. The control unit can also transmit a set brightness value actively to the bus. This means that the newly set brightness value can be transmitted when the control unit is switched on (via the "switching" object), when a running dimming cycle is being terminated or when a value is being received. This function is active only if the Ü flag of the respective "brightness value" objects has been set.

## - Switching status checkback

If the switching status of the control unit changes from "OFF" to "ON" or from "ON" to "OFF", a corresponding switching telegram is transmitted to the bus via the switching status checkback object. If the "Soft-ON" function has been activated and started, a checkback "ON" telegram is transmitted once at the beginning of the dimming cycle. If the "Soft-OFF" has been activated and started, a checkback "ON" telegram is being transmitted at the beginning of the dimming cycle. A checkback "OFF telegram will be transmitted only after the end of the dimming cycle. If the "Soft-OFF" function is started by an elapsed timedimming function, a checkback "OFF" telegram is being transmitted to the bus only after the end of the dimming cycle.
A corresponding switching status checkback telegram is transmitted also in the event of object value updates of the switching object ("OFF" after "OFF" resp. "ON" after "ON").
