

# JUNG Visu Pro

How do I connect Amazon Alexa / Google Home?

# 1. Introduction

With the help of the JUNG Visu Pro server and the MyJUNG Voice Service, the Amazon Alexa and Google Home smart speakers can be simply integrated into the KNX installation.

Control your smart home or smart building easily with voice commands.

This quick start guide explains the individual steps using an example.

## COMMUNICATION MODEL

## 2. Overview

The functions created with JUNG Visu Pro and networked devices can be conveniently controlled with the JUNG Visu Pro skill for Alexa or the JUNG Visu Pro service for Google.

The table on the right gives an overview of the necessary steps.

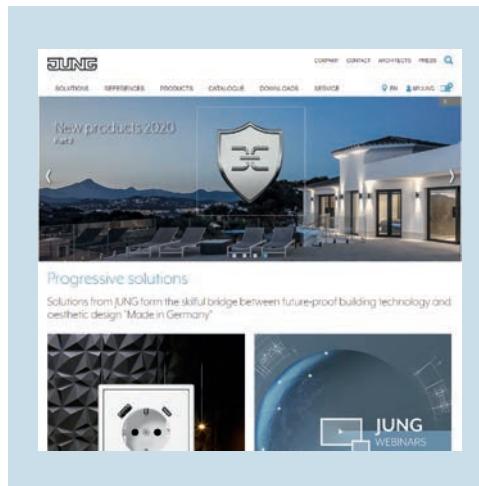

The individual steps are described in detail on the following pages.

STEP	PAGE
1. Update JUNG Visu Pro and log in to MyJUNG	4
2. Configure voice control in JUNG Visu Pro	5
3. Activate voice services using VisServer	6
4. Set up JUNG Visu Pro for Amazon Alexa	7
5. Set up JUNG Visu Pro for Google Home	8
6. Voice commands	9

### 3. Update JUNG Visu Pro and log in to MyJUNG

In the first step, update your JUNG Visu Pro server to software version 4.5.0.8 or higher. Alternatively, download the most current JUNG Visu Pro software version from the online catalogue and install it on your server.

Afterwards, log in to the MyJUNG portal or register for free so that you can activate the voice control.

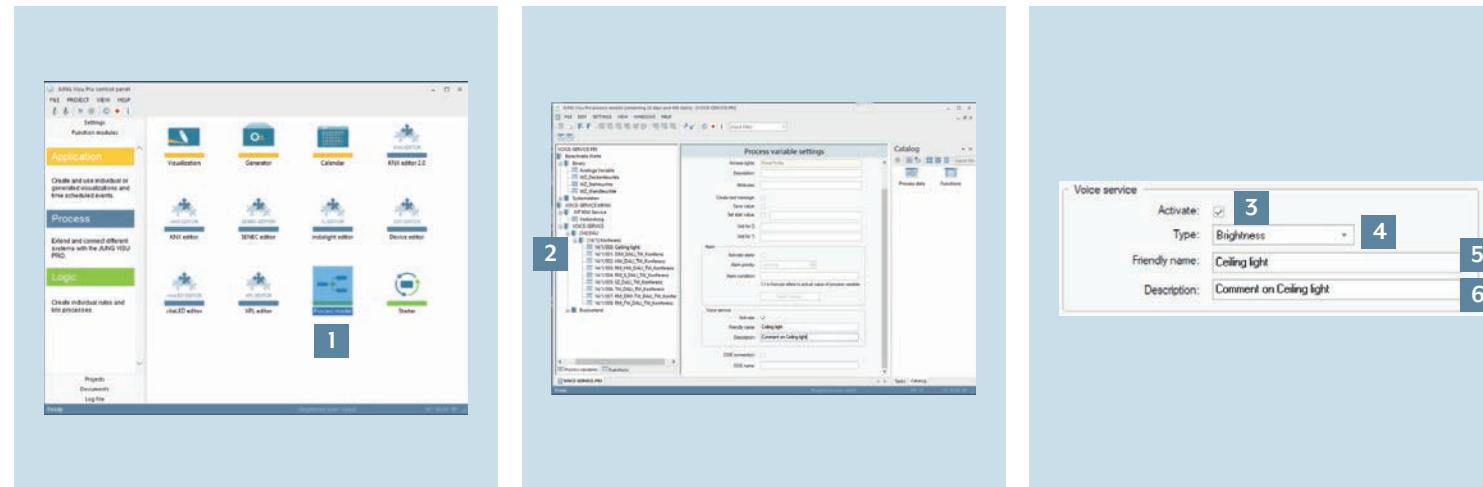

1. Update the [JUNG Visu Pro software](#) (at least version 4.5.0.8.) or install the most recent software version.
2. Log in to [MyJUNG](#) with your login details or register for free.

## 4. Configure voice control in JUNG Visu Pro

To make your KNX system or other functions controllable using voice commands with the JUNG Visu Pro and to complete setting up the voice service, carry out the following steps in the process model.

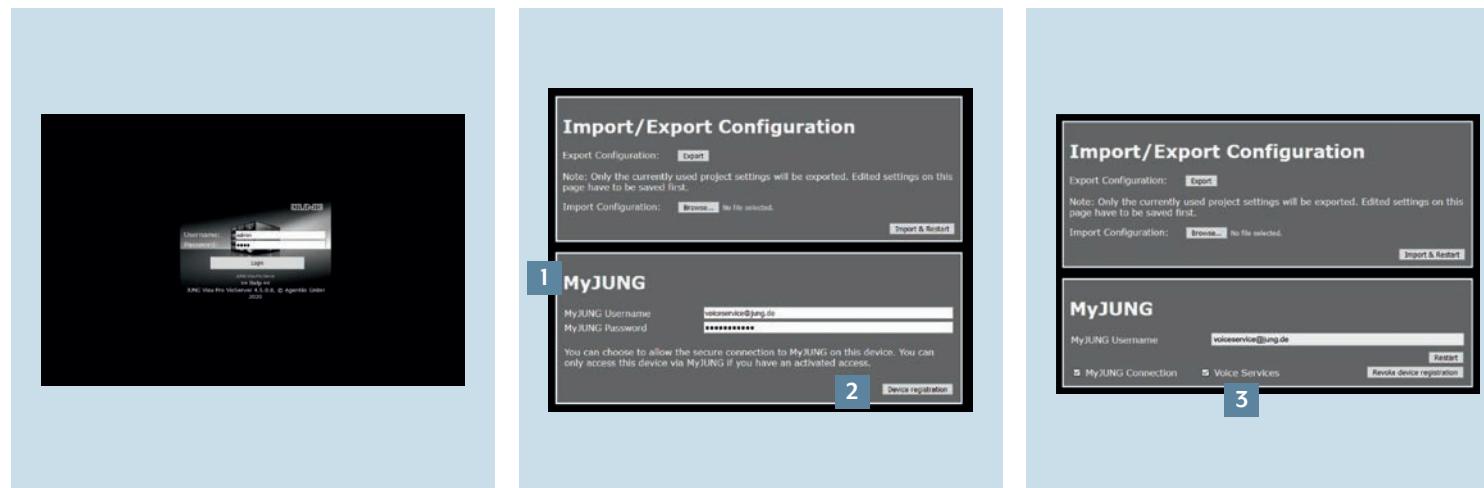

**Note:** Do not forget to save your changes in the process model.

1. Start the JUNG Visu Pro software on your server and open the **process model editor** [1].  
The process model for your project lists all available data points and KNX group addresses for you.
2. Select the **Data point** or the **Function** [2] that you want to control by voice.
3. Once you have selected the function, tick **Activate** [3] in the **Voice service** window.
4. Afterwards, select the appropriate **Function type** [4] (e.g. brightness for a lamp) and allocate a **Friendly name** [5] for the function and also a **Brief description** [6]. The name will be used later as a voice command for your smart speakers.

## 4.1 Activate voice services using VisServer

After you have selected the functions and devices in the process model for the voice control, open the VisServer or the visualisation using an HTML5 browser (e.g. Mozilla Firefox or Google Chrome) on your PC or end device. Complete the configuration as follows.

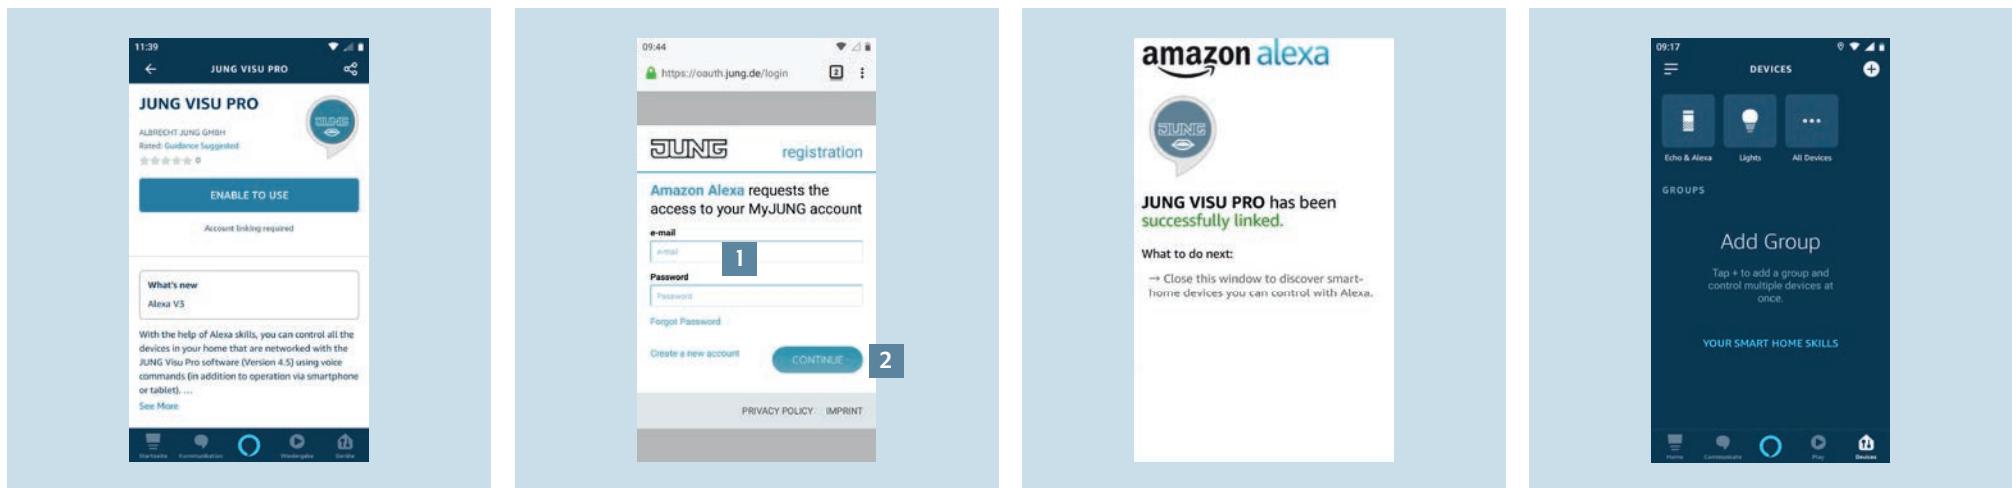

1. Log in to the administration area of the [VisServer](#).
2. Navigate to the [MyJUNG](#) menu point [1] and enter your [MyJUNG](#) login details.
3. Press the [Device registration](#) button [2] to confirm the entry.
4. Activate the voice control by ticking [Voice Services](#) [3].
5. Afterwards, open the [Amazon Alexa app](#) or the [Google Home app](#) on your end device.

## 5. Install the JUNG Visu Pro skill or the JUNG Visu Pro service

Finally, connect the JUNG Visu Pro server and your smart speaker with your MyJUNG account. To do so, load the JUNG Visu Pro skill (for Amazon Alexa) or the JUNG Visu Pro service (for Google Home) in the smart speaker app on your end device. Follow the instructions of the app for the set-up.

### 5.1 Set up JUNG Visu Pro for Amazon Alexa

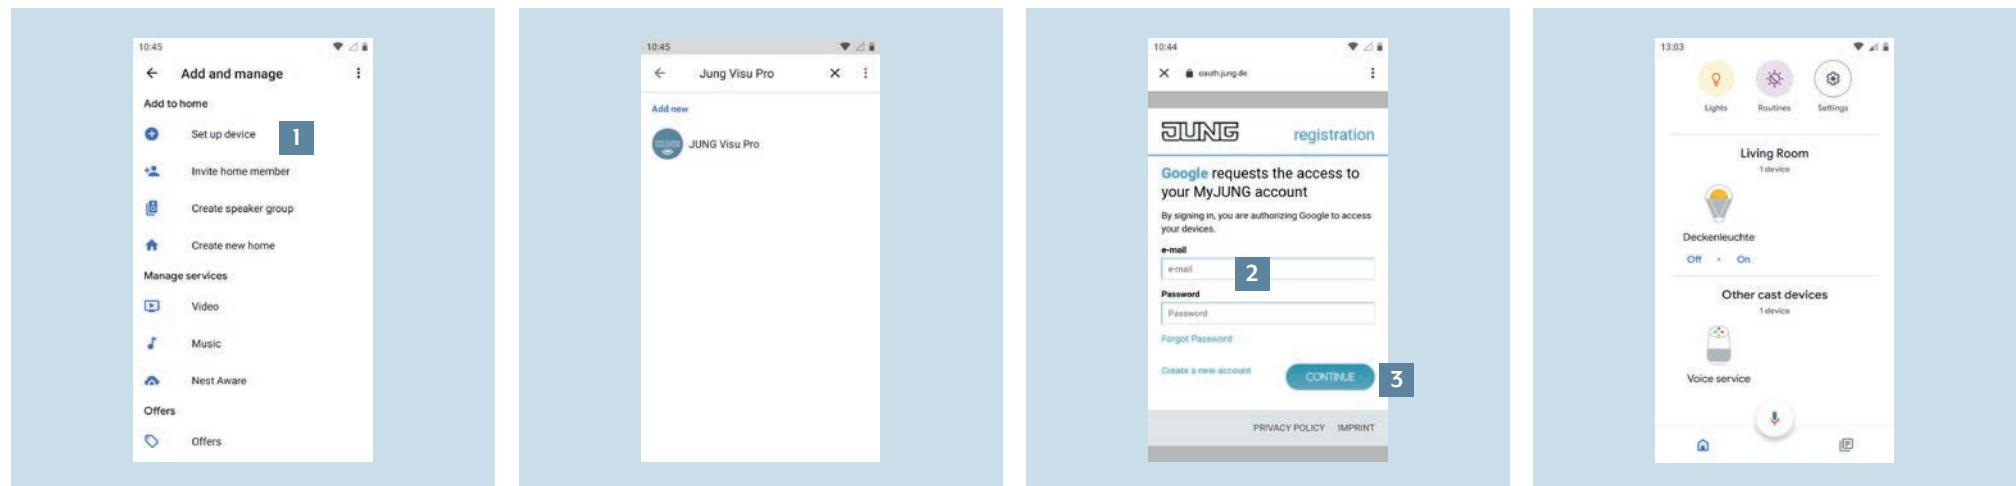

The following steps show you how to set up the JUNG Visu Pro skill for Amazon Alexa.

1. Search for the [JUNG Visu Pro Skill](#) in the [Amazon Alexa app](#).
2. Enter your [MyJUNG login details](#) [1] and click on [Continue](#) [2] to activate the JUNG Visu Pro skill.  
By entering your login details, the JUNG Visu Pro skill is connected to your JUNG Visu Pro server.
3. Finished! You only have to select your devices.
4. The Amazon Alexa app shows you the voice-compatible devices and functions on your KNX system.

## 5.2 Set up JUNG Visu Pro for Google Home

The connection of the JUNG Visu Pro server with Google Home is carried out just as easily as coupling to Amazon Alexa. The following steps show you how to set up the JUNG Visu Pro service for Google Home.

1. In the [Google Home app](#), click on the [Set up device](#) menu item [1].
2. In the [Add new service](#) window, search for [JUNG Visu Pro](#) and add the service by clicking.
3. Enter your [MyJUNG login details](#) [2] and click on [Continue](#) [3] to activate the JUNG Visu Pro service. By entering your login details, the JUNG Visu Pro service is connected to your JUNG Visu Pro server.
4. Finished! It only remains to select your devices.
5. The [Amazon Alexa app](#) shows you the voice-compatible devices and functions on your KNX system.

## 6. Voice commands

After you have completely finished the set-up, you can use the JUNG Visu Pro server in combination with a Smart Speaker. Some possible voice commands are listed below as examples.

TYPE	FUNCTION	EXAMPLES
Switch / dimmer	Switch	Switch on light. Switch off light.
	On / Off	Switch on everything. Switch off everything.
	Dimmer	Dim light to 20 percent. Increase light by 20 percent. Decrease light by 20 percent. Dim light brighter. Dim light darker.
	Dimmer + Switch	Dim light to 20 percent. Increase light by 20 percent. Decrease light by 20 percent. Dim light brighter. Dim light darker. Switch on light. Switch off light.
	RGB (W)	Set light to red. Let light shine in blue. Switch on light. Switch off light.
	Tunable White	Dim light to 20 percent. Increase light by 20 percent. Decrease light by 20 percent. Dim light brighter. Dim light darker. Switch on light. Switch off light.
Motorised drives	Blind / Slat	Set blind to 20 percent.
	Shutters	Move blind to 50 percent.
Climate	Base setpoint	Set temperature in living room to 22 degrees Celsius.
	Setpoint shift	Increase the temperature in living room by 2 degrees Celsius.
	HVAC function group	
Scene	Scene	Activate TV mood.
Actions

# JUNG Visu Pro Server

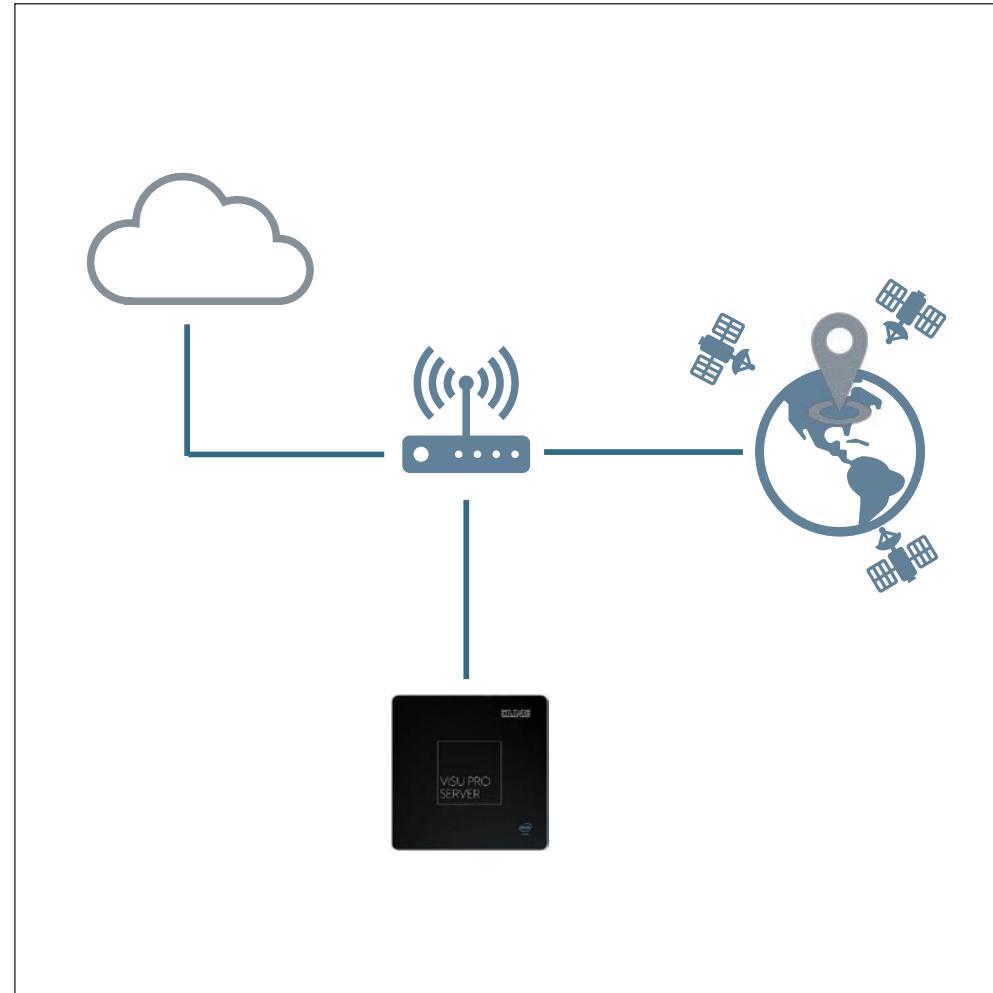

How do I set up the system time?

# 1. Introduction

With JUNG VISU PRO you control your system reliably and comfortably, irrespective of whether in the private or commercial sector.

You can manage several KNX systems independently of each other thanks to the professional software solution. It is important for proper operation that the time is synchronised between the systems and that you set the correct system time for your JUNG VISU PRO Server.

This quick start guide explains the individual steps of commissioning and operation using an example.

COMPONENTS JUNG	PART NO. JVP-SERVER-H2GB	QUAN- TITY 1
Visu Pro Server	JVP-SERVER-H2GB	1

COMPONENTS THIRD PARTY SUPPLIERS	PART NO. hopf 8029 NTS-V2 Zyxel VMG 8546	QUAN- TITY 1 1
hopf 8029 NTS-V2	-	1
Zyxel VMG 8546	-	1

## 2. Overview

The system time of your JUNG VISU PRO Server can be set up in just a few steps.

The table here gives an overview of the necessary steps.

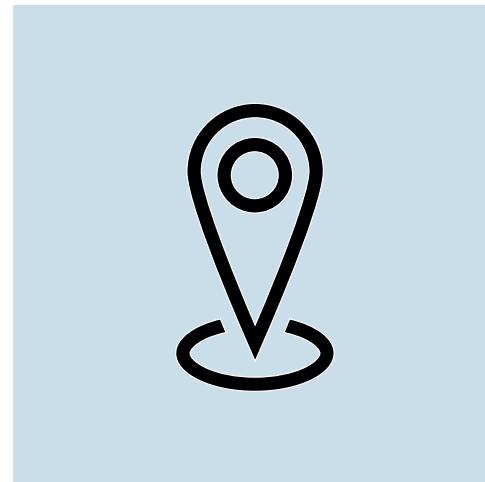

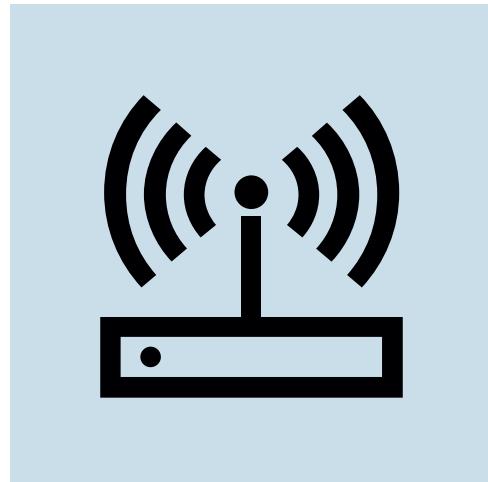

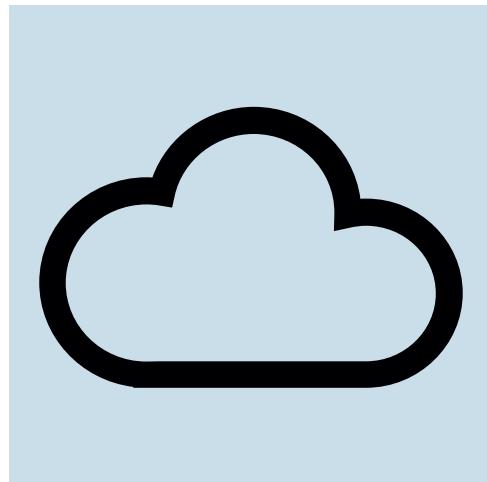

The individual steps are described in detail on the following pages.

STEP	PAGE
1. Why do I need a time server?	4
2. Open clock in Windows 10: NTP server	5
3. Select "Synchronise with an Internet time server" and "Server" (source)	6
4. Use system time of a router	7
5. Use a GPS time server	8
6. Set the clock update rate	9

### 3. Time server

Synchronous system time is indispensable for correct operation within the plant and for time-critical tasks in networks. All clients, i. e. KNX devices, external systems and IP nodes as well as your JUNG VISU PRO Server only work optimally if they are time synchronised. For example, a time server allows all nodes to perform important updates at the same time without a device being disconnected during running operation. Furthermore, on non-time-synchronous systems, requests and commands are rejected if the time stamp between client and server does not match.

You have the following three options for setting up the system time on your JUNG VISU PRO Server:

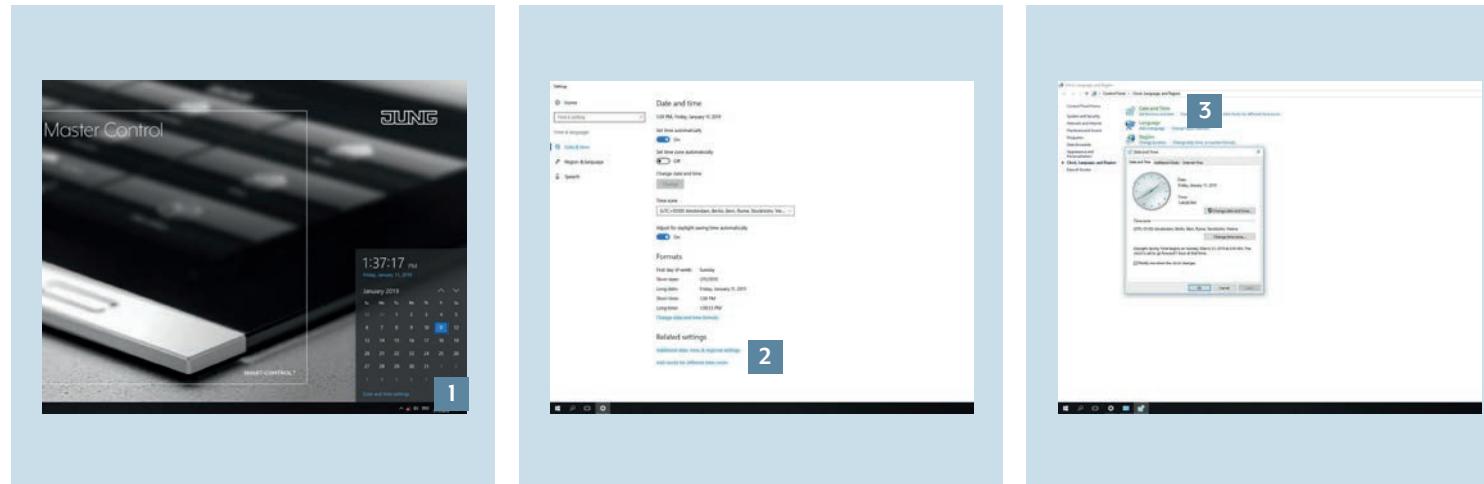

1. Use an NTP server from the Internet.
2. Use the system time of a router.
3. Use a GPS time server in a closed network without Internet.

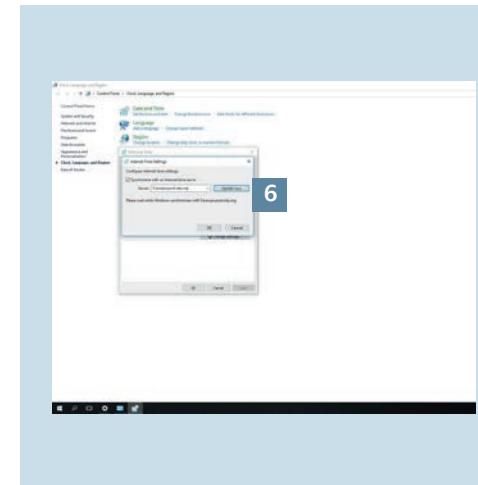

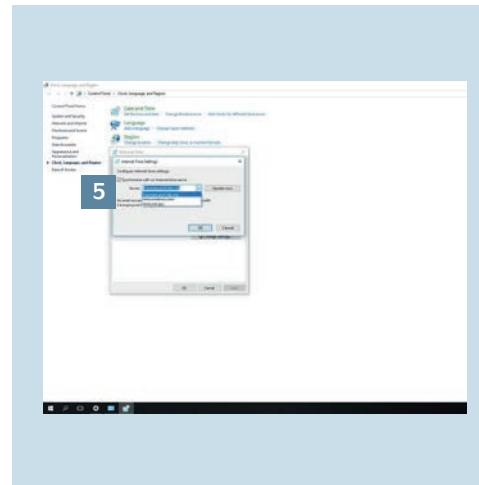

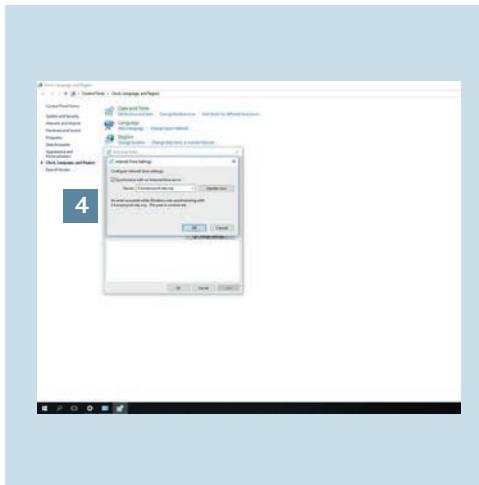

### 3.1 Use an NTP server from the Internet

The Windows 10 operating system with a preconfigured time is installed as standard on your JUNG VISU PRO Server. The following describes how to use an NTP server to synchronise system time on Windows 10. The prerequisite for this is an existing Internet connection.

**Note:** The Network Time Protocol (NTP) is a standard for the synchronisation of clocks in computer systems.

1. Login to your JUNG VISU PRO Server and open the [clock](#). Click on [Date and time settings](#) [1].
2. Under [Related settings](#) then select [Additional date, time & regional settings](#) [2].
3. Then click on [Set the time and date](#) [3]. A pop-up window opens. Then change the current Internet time settings in the [Internet Time](#) tab.

4. Ensure that the checkmark for **Synchronise with an Internet time server** [4] is set. The default time server for JUNG VISU PRO is [0.europe.pool.ntp.org](http://0.europe.pool.ntp.org).

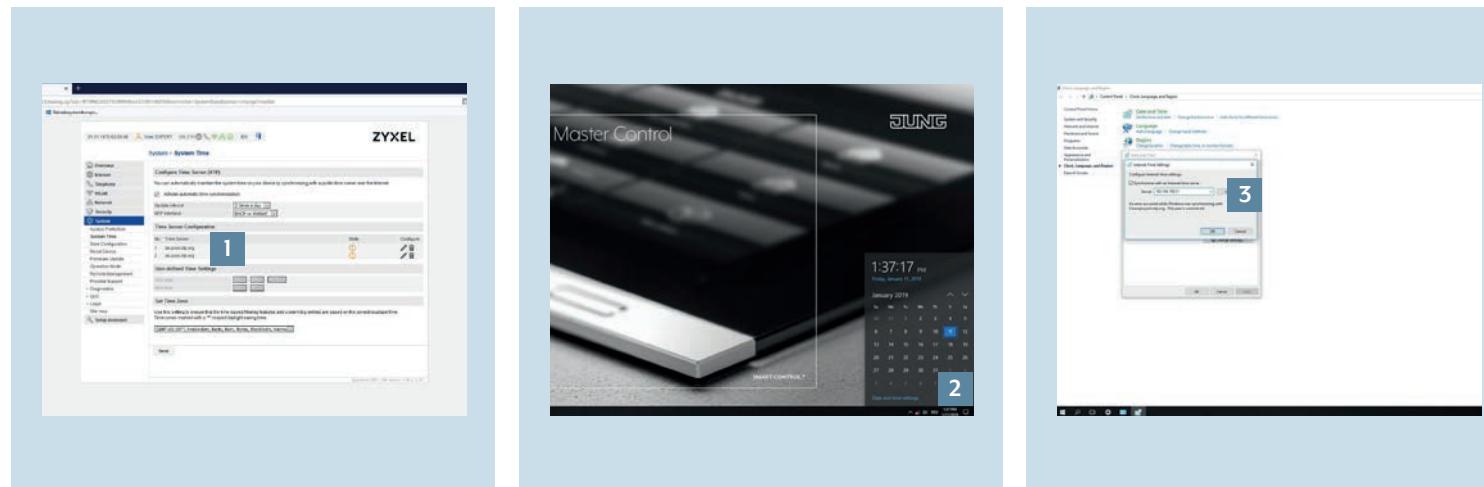

5. If you would like to use another NTP server, enter the address in the input field for **Server** [5].

6. Click on **Update now** [6] to synchronise your JUNG VISU PRO Server with the current time of the NTP server.

## 3.2 Use system time of a router

As an alternative to the NTP time server, you can also use the system time of your router.

**Note:** First check whether your router can be used as an NTP server in your home network. Detailed information for this can be found in the manufacturer documentation of your router. A ZyXel VMG 8546 is used in the following example.

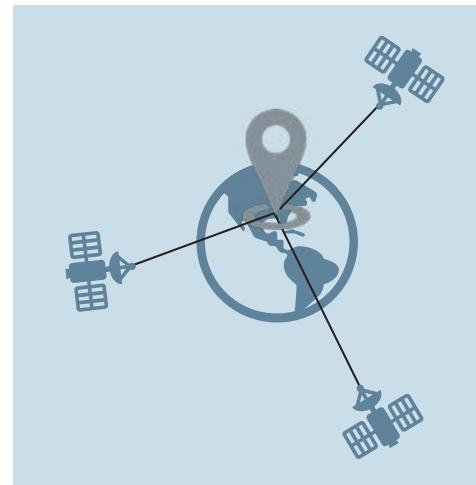

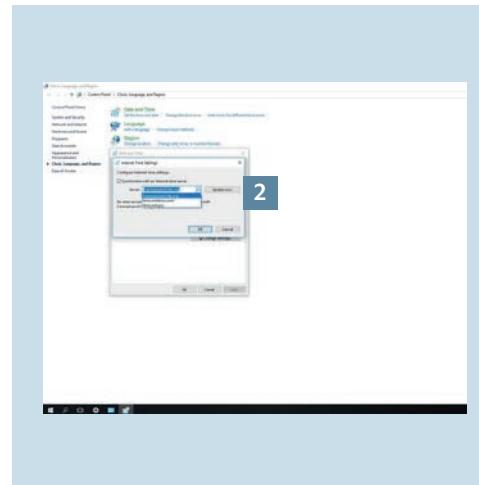

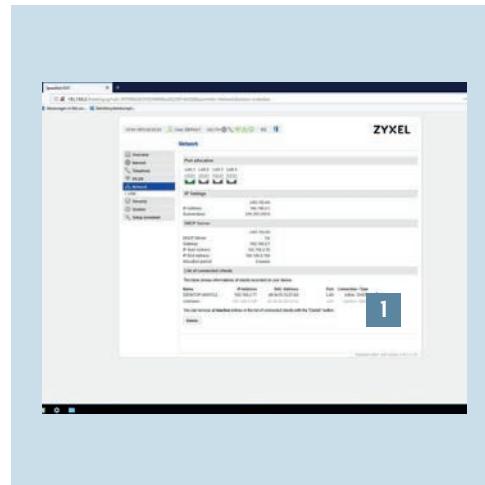

1. Login to the user interface of your router and open the system time settings. There you can either make a user-defined time setting or set a new NTP time server from the Internet [1].
2. Now open the clock [2] again in your JUNG VISU PRO Server and repeat the steps from chapter 3.1 to adjust the Internet time settings.
3. Enter the name or the IP Address (default gateway) [3] of your router in the Server input field in the Internet time tab.

### 3.3 Use a GPS time server

If you use the JUNG VISU PRO Server in a closed network without Internet connection, you can alternatively also synchronise the time with a GPS transmitter. Thereby, you synchronise the GPS device and the JUNG VISU PRO Server via Ethernet in a local network.

**Note:** In this example, a GPS time server from hopf Elektronik GmbH - model 8029 NTS-V2 - is used. It is assumed that the device has already been configured.

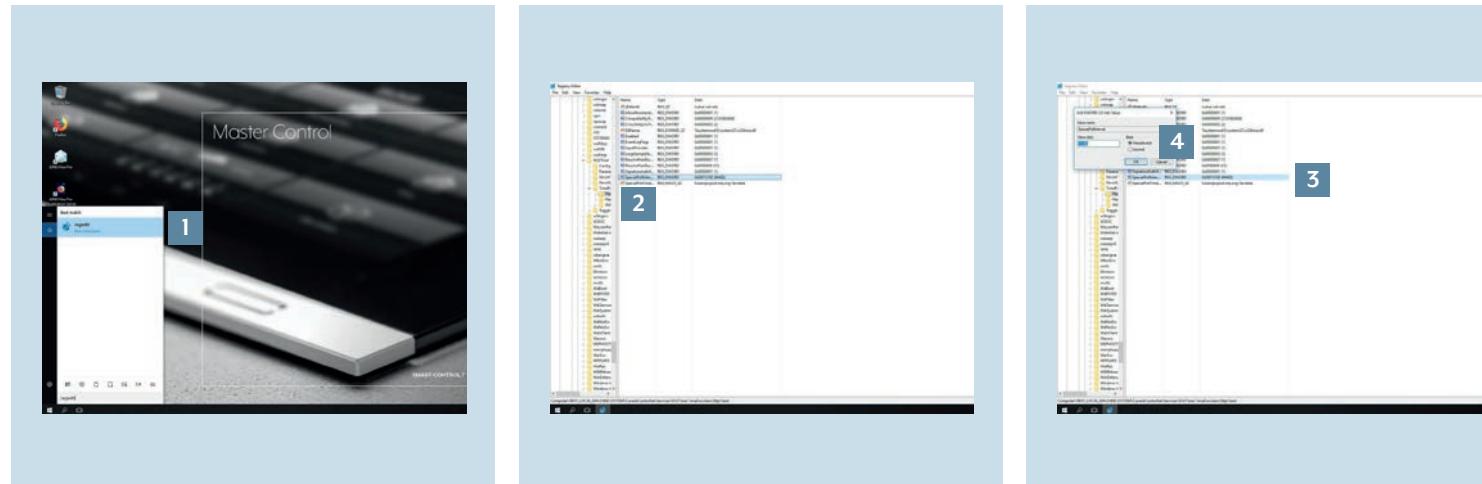

1. Connect the GPS device to a port on your router or switch.
2. Read the [IP address of the GPS device](#) [1] from the network overview of your router or switch.
3. Now navigate again via the [Windows clock](#) to the [Internet settings](#).
4. As described in the previous steps, enter the [IP address of the GPS device](#) in the [Server](#) field [2] in the [Internet time](#) tab.
5. Pay attention to the [reception quality](#) on the GPS device. To do this, check the connection status using the respective manufacturer software or via the web interface.
6. Successful time synchronisation with a GPS signal requires satellite reception. At least [three satellites](#) should be connected with the [GPS device](#) for continuous function. If you use a GPS device as (NTP) time server, ensure that the GPS device is operated as [Stratum 1](#).

## 4. Update rate of the clock

### 4.1 Change update rate manually

Now that you know how to synchronise the time of your JUNG VISU PRO Server, the next section explains how to set the update rate of the clock.

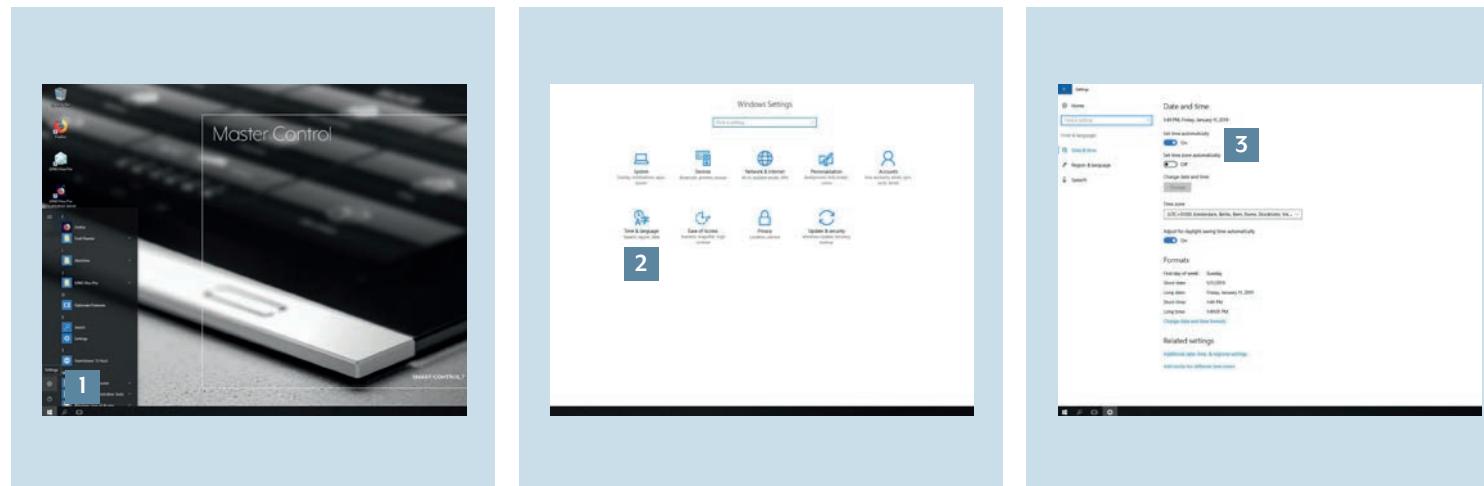

**Note:** The update interval is set to 86,400 seconds (this corresponds to exactly one day) as default.

1. Click on the magnifying glass at the bottom left in the taskbar and enter the command [regedit](#) in the search field [1]. Press the Enter key to confirm the input.
2. Navigate to the subitem [HKEY\\_LOCAL\\_MACHINE\SYSTEM\CurrentControlSet\services\W32Time\TimeProviders\NtpClient](#) [2].
3. Then double click on [SpecialPollInterval](#) [3] on the right. A pop-up window opens, in which you write the value (in seconds) for the [update interval](#) (decimal) [4] – e.g. 86,400 seconds (1 day).

## 4.2 Set time automatically

If the time of the JUNG VISU PRO Server is not displayed correctly although you have carried out the steps described above and a connection to the time server exists, you can correct this with a simple step.

1. Click on the Windows icon in the taskbar or press the Windows key to call the Start menu and open **Settings** [1].
2. Then select **Time & language** [2].
3. You can activate or deactivate the automatic time update of the system using the **Set time automatically** button [3].
4. If you want to update your JUNG VISU PRO Server quickly, set the button here to OFF and then ON - the current time is retrieved from the time server.

## 5. Completion

Congratulations - you now know how to configure the time in your JUNG VISU PRO Server and how to select different time servers for your applications.

# JUNG Visu Pro

**JVP-REMOTE**

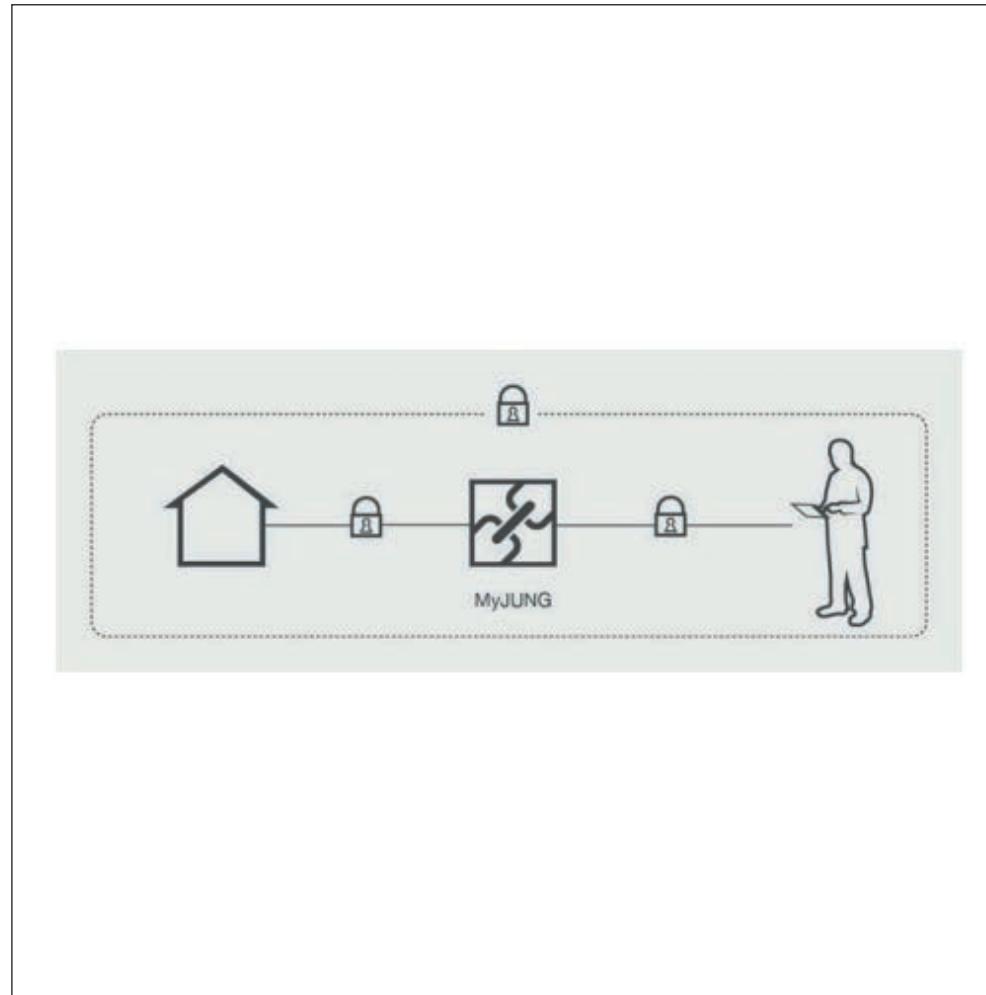

How do I set up remote access?

# 1. Introduction

Convenient and secure remote access:

With the remote access for Jung Visu Pro, you can visualise, control and adapt your KNX system to your requirements at any time and from any location.

This quick start guide explains the individual setting-up steps using an example.

COMPONENTS JUNG	PART NO.	QUAN- TITY
JUNG Visu Pro Server	JVP-SERVER-H2	1
Remote access licence	JVP-L	1

## 2. Overview

The MyJUNG remote access for your JUNG Visu Pro Server can be set up in a few steps.

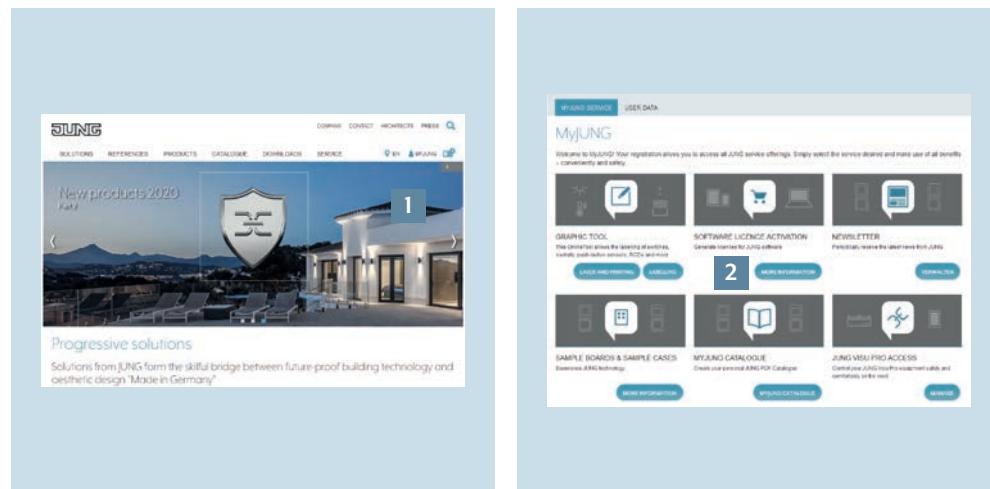

The table here gives an overview of the necessary steps.

On the following pages, the individual steps are described in detail.

<b>STEP</b>	<b>PAGE</b>
1. Register at the MyJUNG portal	4
2. Obtaining a remote access licence for JUNG Visu Pro	5
3. Configuring remote access in the VisServer	6
4. Completing set-up and activating remote access	7
5. JUNG Visu Pro remote access with a smartphone	8

### 3. Activation of the remote access using the MyJUNG portal

First log on to the JUNG web site in the MyJUNG portal with your user data <https://www.jung.de/en/>.

1. Log in to the [MyJUNG portal](#) or register as a new user. [1].
2. Select [More Information](#) [2] in the [Software Licence Activation](#) selection field to purchase a remote access license.

### 3.1 Obtaining a licence and managing subscription

You see the products for which you can purchase additional software or licences in [Software Licence Sales](#).

The figure consists of four screenshots illustrating the software licence purchase and management process:

- Screenshot 1:** Shows the 'Buy software licence' section of the website. It lists various software items like Visu Pro Subscription, Visu Pro Remote, and Visu Pro Server. A blue box highlights the 'Visu Pro Subscription' link.
- Screenshot 2:** Shows the 'Step 1: Selection of period' screen. It asks for the period for which you want to book or extend a channel. An option for 'Online (26.09 EUR)' is selected.
- Screenshot 3:** Shows the 'Step 2: Receive voucher' screen. It asks for a voucher code. A blue box highlights the 'Accept licence data' button at the bottom.
- Screenshot 4:** Shows the 'Activated View Pro Server subscriptions' screen. It lists a single subscription for 'View Pro Server - webinterface'. The table includes columns for Article, Item, Purchased date, Renewal item, Project, Device, and Client. A blue box highlights the 'View Pro Server - webinterface' row.

1. Select the licence purchase for [Visu Pro Subscription](#) [1] in Software Licence Sales.
2. Buy the remote access licence (lifetime) once or enter a voucher code [2].
3. Confirm the licence purchase with [Accept licence data](#) [3].
4. In the [MyJUNG](#) service area, you can then manage your remote access licences and control devices with [Jung Visu Pro remote access](#). The management area gives you an overview of your licences [4].

## 4. Configuring remote access on your JUNG Visu Pro Server

After you have purchased a licence, now activate the remote access on your JUNG Visu Pro Server.

- Call the VisServer using the web browser of your end device (PC, laptop, tablet). To do so, enter the address <http://localhost:8083/> in your web browser.
- Log on to the **administration area** with the default user name **admin** and password **0000**.

1. Log on to the administration area of the **VisServer** [1].
2. Navigate to the **MyJUNG** menu point [2] and enter your MyJUNG data.
3. Confirm the entry with the **Device registration** button [3].
4. To activate the remote access, check the box at **MyJUNG connection** [4].

## 4.1 Completing set-up and activating remote access

Go back to the [MyJUNG](#) Service Portal and complete set-up with the following steps.

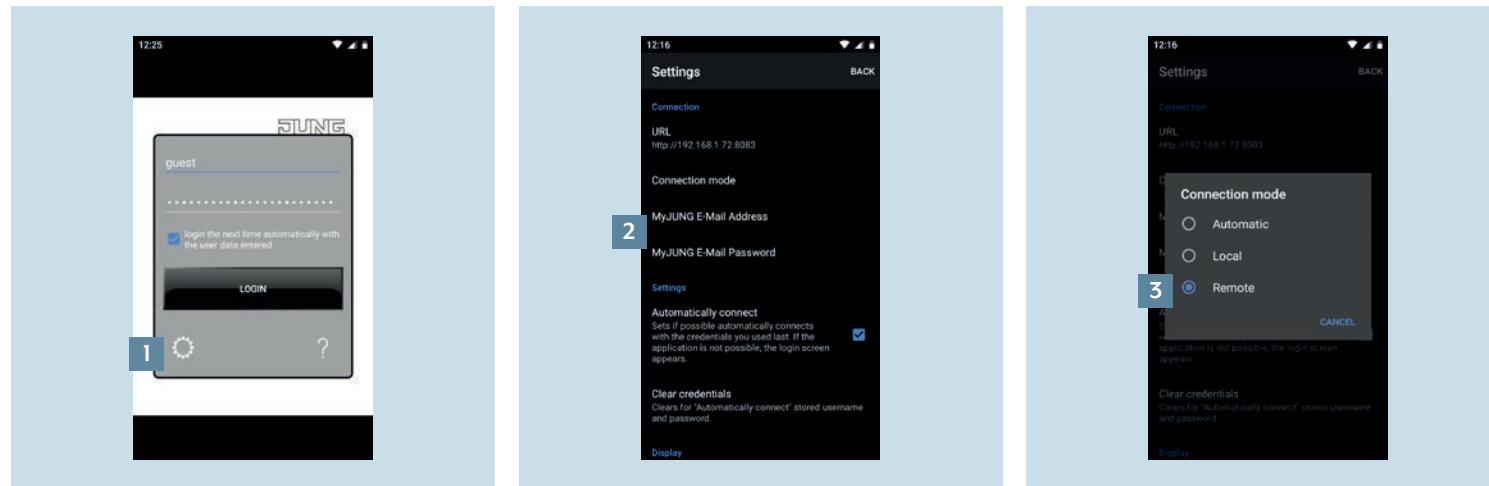

- Under [Assign JUNG Visu Pro devices](#), allocate the appropriate channel and the remote access licence to your JVP Server [1].
- Then you can edit or rename your devices at [Control/manage JUNG Visu Pro devices](#) or [Start remote access](#) via a PC (browser) [2].
- You can now conveniently access your system and the visualisation via your remote access.

## 4.2 Remote access with a smartphone

Setting up the MyJUNG remote access for JUNG Visu Pro on your smartphone is carried out with the following steps.

**Note:** An Android device is displayed in this example. Setting up remote access for iOS devices is carried out in the same way.

1. Open the JUNG Visu Pro app and call the [app settings](#) using the gear icon [1].
2. First enter your [MyJUNG](#) user data (e-mail address and password) [2].
3. Then open the [Connection mode](#) tab in the app menu and change the connection to [Remote](#) [3]. The connection to JUNG Visu Pro is now made with MyJUNG remote access as soon as you close the app settings.
4. If you want the connection to be made automatically locally or remotely dependent on location, select [Automatic](#).
