## 2 Overview

### 2.1 Overview devices

The manual refers to the following push buttons (Order Code respectively printed in bold type):

- RF-GT04W. 01 Glass push buttons 4-fold, white
- surrounding orientation light, white/red LED per button, 2-fold switching output or 1-fold shutter output
- RF-GT04S.01 Glass push buttons 4-fold, black
- surrounding orientation light, white/red LED per button, 2-fold switching output or 1-fold shutter output
- RF-GT08W. 01 Glass push buttons 8-fold, white
- surrounding orientation light, white/red LED per button, 4-fold switching output or 2-fold shutter output
- RF-GT08S. 01 Glass push buttons 8-fold, black
- surrounding orientation light, white/red LED per button, 4-fold switching output or 2-fold shutter output
- RF-GTT4W. 01 Glass push buttons 4-fold, white, integrated temperature sensor
- surrounding orientation light, white/red LED per button, 2-fold switching output or 1-fold shutter output
- RF-GTT4S. 01 Glass push buttons 4-fold, black, integrated temperature sensor
- surrounding orientation light, white/red LED per button, 2-fold switching output or 1-fold shutter output
- RF-GTT8W. 01 Glass push buttons 8-fold, white, integrated temperature sensor
- surrounding orientation light, white/red LED per button, 4-fold switching output or 2-fold shutter output
- RF-GTT8S.01 Glass push buttons 8-fold, black, integrated temperature sensor
- surrounding orientation light, white/red LED per button, 4-fold switching output or 2-fold shutter output

### 2.2 Exemplary circuit diagram

Figure 1: Exemplary circuit diagram RF-GT08.01

Figure 2: Exemplary circuit diagram RF-GTT8.01
At the 8 -fold Glass Push Button, the Channels A and B are in the lower case and the Channels C and are in the upper case. At the lower case, output A is Channel C and output B is Channel D.

### 2.2 Usage \& Area of applications

The push buttons contains of all functions of the binary input and are designed for flush mounting. By a simple push, the push button can call parameterized functions like scenes or dimming functions. All designs contain of a surrounding orientation light and an illuminated sensitive area, which can light white or red and adjusted with additional parameters. Four logics, a cleaning function and a "panic button" complete the service portfolio of the push button.
Additional all Push buttons of the RF series have an actuator output, which can be used as shutter or switching output. The 4 -fold actuator has one actuator module, which can be parameterized as two switching outputs or one shutter output, the 8-fold actuator has two actuator modules.
The push buttons of the series RF-GTT contain additional of an integrated temperature sensor, which can be used for the measurement of the room temperature.

### 2.4 Structure \& Handling

The glass push buttons contain, according to the hardware design, of 4 or 8 buttons. Each contain of a free programmable background-LED. This can light as well red as white in 5 different illumination levels. Additional an orientation light can be activated. The glass surface is available in the colors black or white. Behind the surface, a marking draft can be inserted. A draft with a lot of symbols is available at http://www.mdt.de/EN Downloads.html at the section "Other downloads". All push buttons contains of bus connection at the back of the device as well as programming button at the side. An active programming mode is illustrated by the red programming LED. The push buttons of the series RF-GTTx. 01 have the same style like the devices of the series RF-GT0x.01, but they contain of an additional temperature sensor.

Figure 3: Overview hardware RF-GT04.01

### 2.5 Functions

The functions of the glass push buttons are divided into the general settings, the channel configuration, the settings for the panic button, the configuration of the LED display and the settings for the logic.
At the push buttons of the series BE-GTT, additional settings for the integrated temperature sensor are available.
The following menus can be shown and further parameterized there:

- General settings

The general settings are shown always. Changes, which are made here, are valid for the whole device. Settings for the reset behaviour and general settings can be made here.

- Configuration of the buttons
- disabled

The cannel is disabled and no communication objects are shown for this channel.

- Channels grouped

If a channel is selected as "channel grouped", the pair of channels can be parameterized as dimming function, switching function or shutter function.

## - Channels unique

If a channel is selected as "channel unique", each channel can be parameterized as switch, scene, switch short/long, One-Button dimming or One-Button shuter.

- Panic push button

Here can be selected which function shall be called if more than 3 buttons are pressed. Different functions can be adjusted for the panic push button and the switchover between panic and cleaning can be selected.

- Configuration LED lights

For each button a background LED can be activated and adjusted. The background light can react as well to button activation as to an internal or external object.

- Logic function

Four adjustable logic blocks are available. For these an AND-Operation or an OR-Operation can be selected and the sending object can be parameterized as scene/value (1 Byte) or switch (1 Bit).

- Room temperature (only at BE-GTT)

The integrated temperature sensor can be used for sending the measured temperature to room temperature controller, as for example the SCN-RT6. So, no additional sensor is needed. Settings for the sending conditions of the temperature value and a communication object for an upper and lower threshold are available.

- Outputs

Each pair of outputs can be parameterized as two switching outputs or as one shutter output. According to this setting, the output can be parameterized. If the output is parameterized as shutter, it can be adjusted for controlling shutter or blinds. If the output is parameterized as switching output, it can be adjusted for a switching or a staircase function.
2.5.1 Overview functions

| General settings | Resetverhalten | Behaviour at bus power reset |
| :---: | :---: | :---: |
|  | Time for keystroke long | 0,1-30s, selectable in steps |
| Channels grouped | Dimming function | brighter/darker function can be assigned to the channels freely |
|  | Shutter function | up/down function can be assigned to the channels freely |
|  | Switching function | off/on telegrams can be assigned to the channels freely |
| Channels unique | Switching function | - switching function <br> - toggle function <br> - status function <br> - time functions <br> - switch on/off delay <br> - edge evaluation <br> - forced settings <br> - sending of byte-values |
|  | Scene function | - memory function <br> - selection of different scenes |
|  | Switch short/long | - On-/Off-/toggle function <br> - short/long independent parameterize able |
|  | One button dimming | - steps of dimming <br> - telegram repetition |
|  | One button shutter | - shutter function with only one button |
| Logic functions | AND -operation/OR operation | - Switching function <br> - Sending scenes/values <br> - Inverting |
| Configuration of the LED lights | Status-LEDs | - Connection to internal objects available <br> - Connection to external objects available <br> - Reaction to button activation <br> - LED display behaviour parameterize able <br> - strength and colour adjustable <br> - LED priority adjustabel |
|  | Orientation light | - permanent ON/OFF <br> - Controlling by external object |
| Panic/Cleaning function | Panic function | - different functions available |
|  | Cleaning function | - Switchover cleaning/panic function adjustable |

| integrated temperature sensor | - Sending condition adjustable <br> - Status object for maximum/minimum adjustable |
| :---: | :---: |
| Switching output | - parameterizable as normal switching function or as staircase function <br> - normally closed/normally opened <br> - Blocking behavior adjustable <br> - Central objects adjustable <br> - Scene function <br> - Logic functions |
| Shutter output | - Movement time adjustable <br> - absolute positions <br> - extended scene function <br> - automatic function <br> - extended alarm and blocking function |

Table 1: Overview functions

### 2.6. Settings at the ETS-Software

Selection at the product database:

Manufacturer: MDT Technologies
Product family: Push buttons
Product type:
Medium Type: Twisted Pair (TP)
Product name: addicted to the used type, e.g.: RF-GTT8.01 Push button 8 -fold, integrated temperature sensor
Order number: addicted to the used type, e.g.: RF-GTT8.01

The available parameters depend to the chosen product type. The additional functions for the plus variant are not shown at the normal push buttons.

### 2.7. Starting up

After wiring the allocation of the physical address and the parameterization of every channel follow:
(1) Connect the interface with the bus, e.g. MDT USB interface
(2) set bus power up
(3) Connect and download MDT RF+ Line coupler, RF-LK001.01
(4) Press the programming button at the device(red programming LED lights)
(5) Loading of the physical address out of the ETS-Software by using the interface(red LED goes out, as well this process was completed successful)
(6) Loading of the application, with requested parameterization
(7) If the device is enabled you can test the requested functions(also possible by using the ETSSoftware)

Technical Manual Glass Push Buttons RF-GTXX. 01

## 3 Communication objects

### 3.1 General

The following chart shows the general communication objects:

| Nr. | Name | Object function | Data type | Direction | Info | Tip |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 20/40 | Push button <br> panic | Switch | DPT 1.001 | sending | sends On or Off at <br> acticvating the panic <br> button | lontrolling <br> actuator | Additional function for pressing all <br> buttons |
| 20/40 | Push button <br> panic | Send value | DPT 5.001 | sending | sends adjusted value <br> $(0 . .255)$ at activation <br> of the panic button | controlling <br> actuator | Additional function for pressing all <br> buttons |
| 21/41 | Push button <br> panic | Value for toggle | DPT 1.001 | receive | receives the last state <br> (On/Off) of the <br> controlled actuator | state object <br> actuator, Visu | Additional function for pressing all <br> buttons, for toggle function to get the <br> last state and sending the opposed <br> value |
| $25 / 45$ | Logic input 1 A | Logic input 1 A | DPT 1.001 | receive | logical input (receives <br> on or off) | exernal <br> switching, state <br> objects of other <br> devices | Additional function, up to 4 logical <br> functions are available for the logical <br> module, object appears only by <br> activating, ,Logical object 1-4A <br> (external)" |
| $26 / 46$ | Logic input 1 B | Logic input 1 B | DPT 1.001 | receive | logical input (receives <br> On or Off) | exernal <br> switching, state <br> objects of other <br> devices | Additional function, up to 4 logical <br> functions are available for the logical <br> module, object appears only by <br> activating, ,Logical object 1-4B <br> (external)" |
| $27 / 47$ | Logic output 1 | Logic output 1 | DPT 1.001 | sending | logical output; sends <br> On or Off at activated <br> logic | controlling <br> actuator | Additional function, up to 4 logical <br> functions are available for the logical <br> module |

Technical Manual Glass Push Buttons RF-GTXX. 01

| 27/47 | Logic output 1 scene | Logic output 1 scene | DPT 18.001 | sending | logical output; sends scene at active logic | controlling actuator | Additional function, up to 4 logical functions are available for the logical module |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 37/57 | LED 1 | Switch | DPT 1.001 | receive | $\begin{aligned} & 0=\text { LED On } \\ & 1=\text { LED Off } \end{aligned}$ | external push button, external state objects/ Logical functions | For each button a LED can be activated, Object appears if „, LED 1 4 [8] reacts at: external object" is selected |
| 41/65 | LED priority 1 | Switch | DPT 1.001 | receive | calls parameterized functions for LED priority with 0 or 1 | external button, external state objects/ Logical functions... | Additional function for LED-function, can be activated and parameterized for each LED |
| 45/73 | LED orientation light | Switch | DPT 1.001 | receive | 0 = Orientation light off 1 = Orientation light on | Day/Night object, external buttons, external state objects/logical function | Surrounding orientation light, can be activated once per push button, appears if Oreintation light "over ext. object" is activated |
| 46/74 | LED | Blocking object | DPT 1.003 | receive | $\begin{aligned} & 0=\text { enable LED- } \\ & \text { Function } \\ & 1 \text { = block LED-Funktion } \end{aligned}$ | Day/Night object, button, state object, logical function... | is shown when the LED blocking object is activated, can block, according to the settings, all LEDs or only some |
| 47/75 | Day/Night | Switch | DPT 1.002 | receive | activates day/night mode with 0 or 1 | button, clock timer, Visu | can be activated in the general LEDSettings, switches between day and night mode |
| 48/76 | Temperature | Measurement | DPT 9.001 | sending | sends the current temperature in ${ }^{\circ} \mathrm{C}$ | Visu, Room temperature controller | sends the current temperature, if the room temperature sensor is activated (only at RF-GTTx.01) |

Technical Manual Glass Push Buttons RF-GTXX. 01

| 49/77 Temperature State maximum <br> value DPT 1.001 sending $0=$ maximum value <br> not exceeded <br> $1=$ maximum value <br> exceeded Visu, alarm <br> function... sends a message if the maximum <br> value is exceeded, can be activated in <br> the menu "Room temperature" (only <br> RF-GTTx.01) <br> $50 / 78$ Temperature State minimum <br> value DPT 1.001 sending $0=$ minimum value <br> not undercut <br> $1=$ minimum value <br> undercut Visu, alarm <br> function... sends a message if the minimum <br> value is undercut, can be activated in <br> the menu "Room temperature" (only <br> RF-GTTx.01) |
| :--- |

Table 2: Communication objects general

Technical Manual Glass Push Buttons RF-GTXX. 01

### 3.2 Communication objects per button

The following chart shwos the objects for each button:

| Nr. | Name | Object function | Data type | Direction | Info | Usage | Tip |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Configuration: Push buttons unique: |  |  |  |  |  |  |  |
| 0 | Push Button 1 | Switch | DPT 1.001 | sending | sends On or Off at pushing/releasing the button | controlling actuator | can send the adjusted On or Off signal or both signals at toggelingfunction |
| 0 | Push Button 1 | Send forced setting | DPT 2.001 | sending | sends forced settings On/Off at pushing/relasing the button | controlling actuator/ presence detector... | is shown if button is set as switch, and sub function send value is configured as forced setting (2 Bit) |
| 0 | Push Button 1 | Shutter | DPT 1.008 | sending | controlling shutter with short or long keystroke | controlling up/down movement of the shutter actuator | controlling the up/down movement of shutter/blinds <br> Function: One button shutter |
| 0 | Push Button 1 | Dimming On/Off | DPT 1.001 | sending | Switching object of the dimming functions, sends On/Off | controlling of the switching <br> function of dimming actuators | controlling the switching function of dimming actuators, responds on a short keystroke Function: One button dimming |
| 0 | Push Button 1 | Send value | DPT 5.001 | sending | sends adjusted value (0..255) at pushing/releasing button | sends an absolute value to an actuator | is shown if button is set as switch, and sub function send value is configured as 1 Byte value |
| 1 | Push Button 1 | Value for toggle | DPT 1.001 | receive | receives the last state(On/Off) of the controlled actuator | State object actuator, Visu | for toggle function to get the last state and sending the opposed value |

Technical Manual Glass Push Buttons RF-GTXX. 01

| 1 | Push Button 1 | Stop/Blinds open/close | DPT 1.009 | sending | controlling slats via short or long keystroke, stops active up/down movement | controlling slat function of a shutter actuator | For controlling the step/stop function of shutter/blinds Function: One button shutter |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Push Button 1 | Dimming | DPT 3.007 | sending | sends dimming value (0..255) to actuator | controlling actuator | Value is increased/decreased as long the button is pressed, direction depends to the last value respectively the value of object "Value for toggle" <br> Function: One button dimming |
| 2 | Push Button 1 | Value for change of direction | DPT 1.008 | receive | receives last state (Up/Down) of the controlled shutter actuator | state object actuator, Visu | is used for the shutter function, for knowing the last value and sending the opposed value Function: One button shutter |
| 2 | Push Button 1 | Scene | DPT 18.001 | sending | sends adjusted scene number (1..64) | calling scenes in actuators | sends scene number at pressing the button <br> Function: Scene |
| 4 | Push Button 1 | Blocking object | DPT 1.003 | receive | 0 = enable button function 1 = block button function | state object actuator, other buttons, logical functions... | blockst he button, a blocked button cannot send any value available in all functions |
| +5 next button |  |  |  |  |  |  |  |
| Configuration: Push buttons grouped: |  |  |  |  |  |  |  |
| 0 | Push Buttons 1/2 | Dimming On/Off | DPT 1.001 | sending | Switching object of the dimming functions, sends On/Off | controlling actuator | controlling the switching function of dimming actuators, responds on a short keystroke Function: Dimming |

Technical Manual Glass Push Buttons RF-GTXX. 01

| 0 | Push Buttons 1/2 | Shutter down/up | DPT 1.008 | sending | controlling shutter with short or long keystroke | controlling up/down movement of the shutter actuator | controlling the up/down movement of shutter/blinds <br> Function: Shutter |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | Push Buttons 1/2 | Switch on/off | DPT 1.001 | sending | sends On/Off at pushing the button | Controlling actuator | can send the adjusted On or Off signal or both signals at toggelingfunction <br> Function: Switch |
| 1 | Push Buttons 1/2 | Dimming | DPT 3.007 | sending | sends dimming value (0..255) to actuator | controlling actuator | Value is increased/decreased as long the button is pressed, direction depends to the last value respectively the value of object "Value for toggle" <br> Function: Dimming |
| 1 | Push Buttons 1/2 | Stop/Blinds open/close | DPT 1.009 | sending | controlling slats via short or long keystroke, stops active up/down movement | controlling slat function of a shutter actuator | For controlling the step/stop function of shutter/blinds Function: Shutter |
| 4 | Push Buttons 1/2 | Blocking object | DPT 1.003 | receive | 0 = enable button function 1 = block button function | state object actuator, other buttons, logical functions... | blockst he button, a blocked button cannot send any value available in all functions |
| +10 next grouped buttons |  |  |  |  |  |  |  |

Table 3: Communication objects per button

Technical Manual Glass Push Buttons RF-GTXX. 01

### 3.3 Switching output

The following tabel shows the available objects for a switching output:

| Nr. | Name | Object function | Data type | Direction | Info | Usage | Tip |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| General functions: |  |  |  |  |  |  |  |
| 84 | Central function | Switch on/off | DPT 1.001 | receive | Actuator reacts to Incoming-telegramm | Push buttons, Visu... for manual control | Communication object is always shown and enbales the central on/off switching of all channels, which have an enabled central function |
| Functions per channel: |  |  |  |  |  |  |  |
| 85 | Channel A | Switch on/off | DPT 1.001 | receive | Actuator reacts to Incoming-telegramm | Push buttons, Visu... <br> for manual control | Communication object is shown at the operating mode „switch" and controls the channel On/Off, which is normally connected to all control keys. <br> (= Main function at switch) |
| 86 | Channel A | Staircase | DPT 1.001 | receive | Actuator reacts to Incoming-telegramm | Push buttons, Visu... for manual control | Communication object is shown at the operating mode „switch" and controls the channel On/Off, which is normally connected to all control keys. The channel switches off again after adjusted time is expired. <br> (= Main function at staircase) |
| 87 | Channel A | Block | DPT 1.003 | receive | Actuator reacts to Incoming-telegramm | Push buttons, Visu... for manual control | Communication object is only shown after activation of the blocking object. Object blocks the function of this channel. <br> (= Additional function) |

| 88 | Channel A | Scene | DPT 18.001 | receive | Actuator reacts to Incoming-telegramm | Push buttons, Visu... <br> for manual control | Communication onject appears only after activating scenes. For calling of saved scenes, which are saved in the actuator. <br> (= Additional function) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 89 | Channel A | Status | DPT 1.001 | sending | Actuator sends current state | For diplay on Visu, Tableau, and Display Connection to Push button object „Value for toggle" | Communication object operates as status indication and can be used for visualization... <br> Must be connected to the object "value for toggle" of the controlling push button for sending its current state to the push button. |
| 90 | Channel A | Logic 1 | DPT 1.002 | receive | Actuator reacts to Incoming-telegramm | external switching, state object of other devices | Channel switches only On, if the logic function of activated objects and switching onbject ( Nr .85 ) is true. <br> Only available for switching output. |
| 91 | Channel A | Logic 2 | DPT 1.002 | receive | Actuator reacts to Incoming-telegramm | external switching, state object of other devices | Channel switches only On, if the logic function of activated objects and switching onbject ( Nr .85 ) is true. <br> Only available for switching output. |
| +8 next channel |  |  |  |  |  |  |  |

Table 4: Communication objects switching output

Technical Manual Glass Push Buttons RF-GTXX. 01

### 3.4 Shutter output

The following chart shows the available objects for a shutter output:

| Nr. | Name | Object function | Data type | Direction | Info | Usage | Tip |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Objects for automatic function: |  |  |  |  |  |  |  |
| $\begin{aligned} & 125 \\ & \& \\ & 126 \end{aligned}$ | Automatic A | Automatic position 1-2 | DPT 1.017 | receive | Actuator reacts to Incomingtelegramm | Push buttons, Visu... <br> for manual control | Actuator calls the saved values for this automatic position. Enables the adjustment of absolute values via 1 Bit |
| $\begin{aligned} & 127 \\ & \& \\ & 128 \end{aligned}$ | Automatic B | Automatic position 1-2 | DPT 1.017 | receive | Actuator reacts to Incomingtelegramm | Push buttons, Visu... for manual control | Actuator calls the saved values for this automatic position. Enables the adjustment of absolute values via 1 Bit |
| Objects per Channel: |  |  |  |  |  |  |  |
| 85 | Channel A/B | Shutter up/down | DPT 1.007 | receive | Actuator reacts to Incomingtelegramm | Push buttons, Visu... <br> for manual control | Communication object is shown at the operating mode "Shutter" and enables controlling the standard function up/down, which is normally connected to all control keys. <br> (= Main function for shutter) |

Technical Manual Glass Push Buttons RF-GTXX. 01

| 85 | Channel A/B | Blinds up/down | DPT 1.007 | receive | Actuator reacts to Incomingtelegramm | Push buttons, Visu... <br> for manual control | Communication object is shown at the operating mode „Blinds" and enables controlling the standard function up/down, which is normally connected to all control keys. <br> (= Main function for blinds) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 86 | Channel A/B | Blinds up/down/stop | DPT 1.007 | receive | Actuator reacts to Incomingtelegramm | Push buttons, Visu... for manual control | Communication object is shown at the operating mode "Shutter" and enables the controlling of the standard function slat adjustment (step) and stop , which is normally connected to all control keys. (= Main function for shutter) |
| 86 | Channel A/B | Short time operation | DPT 1.007 | receive | Actuator reacts to Incomingtelegramm | Push buttons, Visu... for manual control | Communication object is shown at the operating mode <br> „Blinds" and enables the controlling of the fine-tuning adjustment of the blinds in step, which is normally connected to all control keys. <br> (= Additional function at shutter) |

Table 6: Communication objects - Default settings
You can see the default values for the communication objects from the upper chart. According to requirements the priority of the particular communication objects as well as the flags can be adjusted by the user. The flags allocates the function of the objects in the programming thereby stands C for communication, R for Read, W for write, T for transmit and U for update.

## 4 Reference-ETS-Parameter Push Button

### 4.1 General

The following parameters are one-time available and affect to alle 4 or 8 channels:

| General Settings |  |
| :--- | :--- |
| Push buttons setting |  |
| Push button 1 <br> Push hutton ? | Behaviour at bus power up |$\quad$ read value for toggle $\quad$.

Figure 4: General settings

The chart shows the available settings for the general settings:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Behavior at power up | - No read value for toggle <br> $\quad$activates the reading of the value for <br> toggle at bus power up |  |

Table 7: General settings

The parameter "Behavior at power up" defines the behavior of the push button at a main power return. The setting "Read value for toggle" effects that all communication objects "value for toggle" are read. So the push button knows the current status of the objects. If you choose the setting "no read value for toggle", the push button will not know the current status of the actor. So the push button assumes an unconfirmed value for the objects "value for toggle" and sends always a " 0 "signal at the next operation. Only now the push button knows the status of the actor and can send the right values. But if you choose the read of these values at a bus power up, the push button will send immediately the right value for toggling.

## Technical Manual Glass Push Buttons RF-GTXX. 01

### 4.2 Configuration

The following illustration shows the available settings for each channel:

| Push button setting |  |
| :---: | :---: |
| Function push buttons 1/2 (top left / right) | Push buttons grouped |
| Function push buttons $3 / 4$ (2. line left $/$ right) | Push buttons unique |
| Function push buttons $5 / 6$ (3. line left / right) | disabled |
| Function push buttons $7 / 8$ (bottom left / right) | disabled |
| Panic push button | not active |
| Cleaning function | Cleaning = long button, Panic $=$ short button |
| Reaction rate | medium |
| Time for keystroke long [s] | 0.4 s |

Figure 5: Configuration of push buttons

The following chart shows the available settings:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Function push buttons $1 / 2$ [7/8] | - disabled <br> - Push buttons grouped <br> - Push buttons unique | Operating mode of the channels |
| Panic push button | - active <br> - not active | activates the panic function |
| Cleaning function | - Cleaning = long button, Panic= short button <br> - Cleaning = short button, Panic= long button | Setting which function shall be called at a long/short keystroke |
| Reaction rate | - fast <br> - medium <br> - slow | Adjustment of the reaction rate respectively debounce time of the push buttons |
| Time for keystroke long [s] | $\begin{gathered} 0,1 s-30 s \\ {[0,4 s]} \\ \hline \end{gathered}$ | defines the time when the ETS recognizes a long keystroke |

Table 8: Channel configuration

- Three operating modes can be choosen at the submenu push button settings for each button. The further parameterization options depend on the choosen mode. If a channel is deactivated, so choosen as "disabled, there are no further parameterization options for this channel.
- By the activation of the panic buttons, an additional submenu is shown in which this function can be parameterized. Also the polarity if at a short or at a long keystroke the panic or the cleaning function shall be activated can be adjusted.
- The raction rate is the debouncing time of the push buttons. This can be chosen as slow, medium or fast and defines how long a buttons must be pressed for calling the function. In order that at a call of the panic or cleaning function no unrequested function is called, this function should be adapted to the user.
- The parameter "Time for keystroke long" allocates a static value to the push button from which time a long keystroke is recognized. This parameter is important for functions, which have different functions for a long and a short keystroke.

### 4.3 Identical parameter

### 4.3.1 Blocking object

As well for grouped channels as for unique channels the blocking object can be activated. At the unique channels one blocking object for every channel can be activated. For grouped channels, you can activate one blocking object for both channels. The communication object for a channel appears as soon as it is activated for a channel. So there are up to 8 blocking objects parameterize able at a 8fold push button. The corresponding channel of the blocking object is blocked by sending a logical 1. A blocked channel is not controllable as long as it is blocked. By sending a logical 0, the channel can be unblocked again.

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 4 | Blocking object | 1 Bit | blocks the related channel by sending a logical 1 |

Table 9: Communication object blocking object

### 4.4 Parameter Channels grouped

The chart shows the setting options for grouped channels:

| ETS-text | Dynamic range <br> [default value] | comment |  |
| :--- | :---: | :--- | :--- |
| Button A/B | - | Dimming <br> - Shutter <br> Switch | Operating mode of the channel |
| Dimming function A/B | - | Brighter/Darker <br> Darker/Brighter | Defines which channel should <br> dim up and which should dim <br> down |
| Shutter function A/B | - | Up/Down <br> Down/Up | Defines which channel should <br> drive the shutter a down and <br> which up |
| Switch function A/B | -On/Off <br> Blocking Object | - | Inactive |

Table 10: Parameter Channels grouped

By choosing channels as grouped, two channels become one common function. The grouped function is called dual surface, like dual surface dimming, and dual surface shutter. In contrast to the single surface functions, one action can be performed independent form the other one. One input performs always one function. The assignment for the buttons can be made individually, so it is possible to configure which button should for example drive the shutters up and which down.

### 4.4.1 Dimming

The dual surface dimming function (channels grouped) is for controlling dimming actuators by startstop dimming commands.
The following parameters are visible, when a pair of channels is chosen as dimming-function:

|  | Buttons $\mathbf{1 / 2}$ |
| :--- | :--- |
| Buttons $1 / 2$ | Dimming |
| Dimming Function $1 / 2$ | Brighter/Darker |
| Blocking Object | Active |

Figure 6: Parameter dual surface dimming

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Dimming on/off | 1 Bit | Switching function of the dimming process; <br> action for a short keystroke |
| 1 | Dimming | 4 Bit | Dimming function; action for a long keystroke |

Table 11: Communication objects dual surface dimming

When a pair of channels is parameterized as dimming function, two objects are shown. One object reacts to a short keystroke, the switching object "Dimming on/off", and the other object reacts to a long keystroke, the dimming object "dimming".
It is possible to parameterize this function as brighter/darker or as darker/brighter. The first function belongs always to the first button. If you switch this parameter, the function will be switched automatically.
By choosing the dimming function (channel $A / B$ ) as brighter/darker, the function reacts in this way: A short keystroke at button A switches the lights on. The lights are switched off by a short keystroke at button B. A long keystroke dims the lights step by step until releasing the long keystroke. The lights are dimmed brighter at button $A$ and darker at button $B$. The push button starts always with the last brightness level, before switching off.
The step size is set fixed to $100 \%$ at the dual surface dimming. It is a start-stop dimming. that means the lights are dimmed as long as you hold the button. After releasing the button a stop value is sent, which stops the dimming process. So you can dim the lights with only one keystroke from $0 \%$ to $100 \%$ or from $100 \%$ to $0 \%$, by pushing the button long enough.

The chart shows the correlations between the dimming- and the switching-object:

|  | Function Brighter/Darker |  |  | Function Darker/Brighter |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Button | Button A | Button B |  | Button B |  |
| Dimming function | Brighter | Darker |  | Brighter |  |
| Switching function | On | Off | Darker | On |  |

Table 12: Dimming function

The following diagram shows the dual surface dimming function:

### 4.4.2 Shutter

The two button shutter-function triggers shutter actuators, which can drive shutter and blinds. The following parameters are shown, when a pair of channel is adjusted as shutter function:

|  | Push buttons 1/2 |
| :--- | :--- |
| Push buttons $1 / 2$ | Shutter |
| Shutter function $1 / 2$ | Up. Down |
| Operation function | Long=move / short=stop/Slats |
|  |  |
| Blocking object | not active |

Figure 7: Two button shutter function

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Shutter Down/Up | 1 Bit | Driving function for the shutters, action for a <br> long keystroke |
| 1 | Stop/Blinds Open/Close | 1 Bit | Stop/Adjustment of the blinds, action for a <br> short keystroke |

Table 13: Communication objects two button shutter function

If you choose a pair of channels as shutter function, two communication objects will appear for this pair of channel. On the one hand the stop/blind adjustment object called "Stop/Blinds Open/Close", which responds to a short keystroke and on the other hand the driving object called "Shutter Down/Up", which responds to a long keystroke.
The driving object is for moving the shutters up and down. The stop-/blind adjustment object is for the adjustment of the blinds and additional it stops a running movement of the shutter.
Every shutter actuator controls with a 0-signal the up-movement and with a 1-signal the down movement. So the push button sends these signals to the corresponding driving commands. From hardware version 2.0 (have a look at the print of the side of the device: RX.X), it is additional possible to switch the functions for a long and a short keystroke. So it can be chosen whether he shutter/blinds shall be driven via a long or a short keystroke. The Stop-/Blind adjustment object is adjusted by the other operating concept.

The Chart shows the correlations between the Stop-/Blind adjustment object and the driving object for the individual channels:

|  | Function Down/Up |  |  | Function Up/Down |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Button | Button A | Button B |  | Button B |  |
| Stop-/Blind <br> adjustment object | Down | Up |  | Up | Down |
| Driving object | Stop/close blinds | Stop/open blinds |  | Stop/open blinds | Stop/close blinds |

Table 14: Shutter function

### 4.4.3 Switch

The values for on and off can be assigned freely at the switching function for the grouped channels. If you adjust a pair of channel as switch, the following parameters will be shown:

| Buttons 7/8 |  |
| :--- | :--- |
| Buttons 7/8 | Switch |
| Switch function 7/8 | on / off |
| Blocking Object | Inactive |

Figure 8: Two button switching function

Simple functions, like an alternating circuit, can be programmed easily by using the grouped switch function. The 1 bit communication object sends in dependence of the parameterization a 0- or a 1signal for the first button and the inverted signal for the second channel. So you can chose which channel should switch off and which should switch on.

The following chart shows the corresponding communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Switch On/Off | 1 Bit | Switching object for the dual surface switching <br> function |

[^0]
### 4.5 Parameters channels unique

There are 6 different operating modes for the unique channels, which can be adjusted for each channel:

- Inactive
- Switch
- Scene
- Switch short/long
- One button dimming
- One button shutter

After the assignment of the operating mode the further parameterization can be done. If the channel is selected as inactive, no further parameterization will be possible.

### 4.5.1 Switch

The switching function is for switching the corresponding output on, off and toggling it. There is a multitude of sub-functions at the switching function, which enables the user to evaluate edges and integrate times to the switching process.

The following parameters are shown, when the channel is selected as switch:

|  | Push button 1 |
| :--- | :--- |
| Function | Switch |
| Subfunction | Toggle by push <br> Switch by push <br> Togile bu push |
| Swith by rease <br> Toggle by release <br> Send Status <br> Send value by push <br> Send value by release <br> Send value by push and release <br> Send Status with on-delay <br> Send Status with off-delay |  |

Figure 9: Parameter switch

Various sub-functions are available at a switching output. Most of these sub-functions contain also of further parameterization-options. The different sub-functions as well as their parameterizationoptions are described in the following segments:

## Technical Manual Glass Push Buttons RF-GTXX. 01

### 4.5.1.1 Switch by push/release

The following setting options are available, when the sub-function switch falling/rising edge was adjusted:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Value for release/push | - On | switches on/off at push/release |

Table 16: Parameter switch by push/release

The sub-function "switch by push" or "switch by release" sends only a signal at the adjusted action. You can parameterize whether a 0-signal or a 1-signal should be sent. There is no inverted signal at subsiding the edge. This function always sends only one adjusted signal.
The following diagram shows this sub-function for switch by push. As soon as the state changes from 0 to 1, the push button sends an On-pulse (=1-signal):

The following chart shows the corresponding communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Switch | 1 Bit | Switching function, no differences between a <br> long and a short keystroke |

[^1]
### 4.5.1.2 Toggle by push/release

The sub-function "toggle by push" or "toggle by release" toggles at the adjusted action. That means, the current value of the communication object is inverted at every switching process. By using this function an edge based alternating circuit can be realized.
The following diagram describes this sub-function. As soon as the state changes from 1 to 0 , the push button sends the inverted signal. The signal is send always as a short pulse:

The following chart shows the corresponding communication objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Switch | 1 Bit | Switching function; no differences between <br> long and short keystroke |
| 1 | Value for toggle | 1 Bit | status object, indicates the switching state of <br> the channel |

[^2]To be sure that the push button toggles at every switching process, you have to connect the status object of the push button "Value for toggle" with the status object of the actuator. When the push button should work without an actuator, the object has to be connected to the switching object "switch". The connection is important, because the push button cannot invert the signal, when it does not know its current state.
By undocking this communication object, you have more choices to program the push button. So you can use the object "Value for toggle" for visualizations or additional functions and you will be more free in design your project.
So you have for example the option to visualize the switching process by connecting the status-object to a switching object of a LED or something else.

## Technical Manual Glass Push Buttons RF-GTXX. 01

### 4.5.1.3 Send Status

By using the sub-function „Send status" the push button sends always the parameterized signal for the corresponding action. The following window is shown for the sub-function "Send status":

|  | Push button 1 |
| :--- | :--- |
| Function | Switch |
| Subfunction | Send Status |
| Value for push | on |
| Value for release | off |
|  |  |
| Blocking object | not active |

Figure 10: Sub-function send status

These settings are available:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| Value for push | - On | switches on/off by pushing |
| Value for release | - Off | switches on/off by releasing |

Table 19: Parameter Send status
The corresponding communication object is shown at the following chart:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Switch | 1 Bit | Switching function; no differences between <br> long and short keystroke |

[^3]The parameter "Value for push" defines whether the channel should send an 1-signal (value: On) or a 0 -signal (value: Off). If you want for example switch a channel of a switch actuator, you will have to choose different values for push and release. Otherwise the push button sends the same signal twice, for example an On-signal.
The cyclic sending causes that the state of the push button is sent periodically in certain parameterize able intervals. Then the push button sends the parameterized value for the corresponding edge.
A common application for this parameter is for example the observation of windows, which are equipped with window-contacts. So a display can for example show whether all windows are closed or not. Furthermore an alarm device can operate with this function.
The following diagram describes this sub-function. In this example, the push button sends a 1-signal for release and a 0-signal for push. Additional the diagram shows the connection with a switch actuator, which was parameterized with a normal switching function:

### 4.5.1.4 Send Value by push/release/push and release

There are two further sub-functions at the sub-function Send Value. On the one hand you can send 1 Byte Values and on the other hand you can activate a forced setting (2 Bit). These functions can be parameterized according to your wishes.
The following illustration shows this parameter:

| Function | Switch |
| :--- | :--- |
| Subfunction | Send value both edges (1Byte / 2Bit) |
| Value (1Byte) / forced setting [2Bit) |  |
| Value for risinge edge | 0 |
| Value for falling edge |  |
|  |  |
| Behaviour at Bus power up | send nothing |
| Blocking Object | Inactive |

Figure 11: Sub-function send value

After activating the sub function „Send value", you have to choose which values should be sent. The setting options are shown at the chart:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| Value (1 Byte)/ forced <br> setting(2 Bit) | - 1 Byte Value | Choice between 1 Byte- and 2 <br> Bit-Value |

Table 21: Parameter send value
If you have activated the setting " 1 Byte", the following settings are possible:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Value for psuh/release | $0-255$ <br> $[0]$ | Assignment, which value <br> should be send for <br> push/release |

Table 22: Parameter send value, 1 Byte object
The 1 Byte communication object can send any value in its dynamic range at both edges. The dynamic range is thereby from 0-255. Depending on parameterization the push button sends the adjusted values for the rising or the falling edge or for both edges.
The following chart shows the according communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Send value | 1 Byte | sends the parameterized value |

Table 23: Communication object Parameter Send value-1 Byte object

The setting option 2 Bit value (forced setting) has the following options to parameterize this function:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Send forced setting at <br> rising/falling edge | Forced setting not active | Assignment, which forced <br> setting should be send at which <br> - |

Table 24: Dynamic range send value-forced setting

The forced setting object allows for example to control the automatic brightness control of presence detectors.
The forced setting object can send 3 different states:

- Forced setting not active (control=0; value=0)

The forced setting object has no influence on the receiver. For example at a presence detector, the automatic function (motion detector operation) would be switched on.

- Forced setting off (control=1; value=0)

The forced setting object switches the receiver unconditionally off. For example a presence detector, would be switched permanent off. Detected motions have no influence on the output.

- Forced setting on (control=1, value=1)

The forced setting object switches the receiver unconditionally on. For example a presence detector, would be switched permanent on. Detected motions have no influence on the output.

The according communication object is shown at the chart:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Send forced setting | 2 Bit | sends the adjusted forced setting |

Table 25: Communication object Send value-forced setting

### 4.5.1.5 Send value with on/off delay

The following setting options are available at the function "Send value with on/off delay":

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Delay time | $0-60 \mathrm{~min}$ <br> [1s] | Adjustment of the delay time <br> for the sending process |

Table 26: Parameter Send value with delay

The sub-function "Send value with on/off delay" allows that the push button sends its value after a parameterized time. At the on-delay, the time starts when the associated button was switched on and at the off-delay, the time starts when the associated button was switched off. The push button sends always its current value at this function. If the value changes before the time ran out, the ondelay will expire. For example, when an input with a parameterized on-delay is switched off, before it was switched on, the input remains off.
The following diagram describes the sub-function „Send value with on-delay":

You can see the adjusted settings, which were made in the ETS for this setting:

Figure 12: Send value with on-delay

The following chart shows the communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Switch | 1 Bit | Switching function; no differences between <br> long and short keystroke |

[^4]
### 4.5.2 Scene

The scene function calls scenes, which are saved in actuators. Scene numbers in the push button and the actuators must be identical. It is possible to save scenes by a long keystroke if the saving function was activated.

The following illustration shows the setting options for this parameter:

| Button 4 |  |  |
| :---: | :---: | :---: |
| Function | Scene |  |
| Subfunction | Save | - |
| Scene Number |  | - |
| Blocking Object | Inactive | $\checkmark$ |

Figure 13: Parameter Scene

The following chart shows the dynamic range of this parameter:

| Sub-function | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Saving function | - No save <br> - Save | Saving function is selected ba a long keystroke |
| Scene number | $\begin{gathered} 1-64 \\ {[1]} \end{gathered}$ | Scene number must be identical with the one in the actuators |
| Blocking object | - Inactive <br> - Active | have a look at 4.3.1 blocking object |

Table 28: sub-function scene

The chart shows the communication objects for this parameter:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 2 | Scene | 1 Byte | calls the depending scene |

Table 29: Communication object Parameter scene
The scene function calls scenes, which were stored in actuators. Scenes contain of parameterized states of several actuators, which can be called with only one keystroke by using the scene function. Additional to the call of scenes, scenes can be saved at the call of a push button by a long keystroke. When the saving function was activated, a long keystroke at the push button saves the current state of the actuators to the depending scene.

## Technical Manual Glass Push Buttons RF-GTXX. 01

For calling a scene or saving a new value for the scene, you have to send the accordingly code to the relevant communication object for the scene:

| Scene | Retrieve |  | Save |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Hex. | Dec. | Hex. | Dec. |
| 1 | $0 \times 00$ | 0 | 0x80 | 128 |
| 2 | $0 \times 01$ | 1 | 0x81 | 129 |
| 3 | $0 \times 02$ | 2 | $0 \times 82$ | 130 |
| 4 | $0 \times 03$ | 3 | 0x83 | 131 |
| 5 | $0 \times 04$ | 4 | 0x84 | 132 |
| 6 | $0 \times 05$ | 5 | 0x85 | 133 |
| 7 | $0 \times 06$ | 6 | 0x86 | 134 |
| 8 | $0 \times 07$ | 7 | 0x87 | 135 |
| 9 | $0 \times 08$ | 8 | 0x88 | 136 |
| 10 | $0 \times 09$ | 9 | 0x89 | 137 |
| 11 | $0 \times 0 \mathrm{~A}$ | 10 | 0x8A | 138 |
| 12 | $0 \times 0 \mathrm{~B}$ | 11 | 0x8B | 139 |
| 13 | $0 \times 0 \mathrm{C}$ | 12 | 0x8C | 140 |
| 14 | 0x0D | 13 | 0x8D | 141 |
| 15 | 0x0E | 14 | 0x8E | 142 |
| 16 | $0 \times 0 \mathrm{~F}$ | 15 | 0x8F | 143 |
| 17 | $0 \times 10$ | 16 | 0x90 | 144 |
| 18 | $0 \times 11$ | 17 | $0 \times 91$ | 145 |
| 19 | $0 \times 12$ | 18 | 0x92 | 146 |
| 20 | $0 \times 13$ | 19 | $0 \times 93$ | 147 |
| 21 | $0 \times 14$ | 20 | 0x94 | 148 |
| 22 | $0 \times 15$ | 21 | 0x95 | 149 |
| 23 | $0 \times 16$ | 22 | $0 \times 96$ | 150 |
| 24 | $0 \times 17$ | 23 | $0 \times 97$ | 151 |
| 25 | $0 \times 18$ | 24 | $0 \times 98$ | 152 |
| 26 | $0 \times 19$ | 25 | 0x99 | 153 |
| 27 | 0x1A | 26 | 0x9A | 154 |
| 28 | 0x1B | 27 | $0 \times 9 \mathrm{~B}$ | 155 |

| 30 | 0x1D | 29 | 0x9D | 157 |
| 31 | 0x1E | 30 | 0x9E | 158 |
| 32 | 0x1F | 31 | 0x9F | 159 |

[^5]
## Technical Manual Glass Push Buttons RF-GTXX. 01

### 4.5.3 Switch short/long

The parameter switch short/long can assign the push button different switching processes for a long and a short keystroke.
The following illustration shows the sub-functions for this parameter:

|  | Button 4 |
| :--- | :--- |
| Function | Switch short/long |
| Value for keystroke short - Object 1 | On |
| Value for keystroke long - Object 2 | Nothing |
| Blocking Object | Inactive |

Figure 14: Parameter switch short/long

The sub-functions for this parameter are shown in the chart below:

| Sub-function | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Value for keystroke short Object 1 | - On <br> - Off <br> - Toggle <br> - Send value <br> - Nothing | Action for a short keystroke |
| Value for keystroke long Object 2 | - On <br> - Off <br> - Toggle <br> - Send value <br> - Nothing | Action for a long keystroke |
| Blocking object | - Inactive <br> - Active | have a look at 4.3.1 blocking object |

Table 31: Sub-functions parameter switch short/long

The chart shows the associated communication objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | push-button short | $1 \mathrm{Bit} / 1$ Byte | Switching function short keystroke |
| 2 | push-button long | $1 \mathrm{Bit} / 1$ Byte | Switching function long keystroke |

Table 32: Communication object parameter switch short/long

The parameter "switch short/long" can control for example two channels of an actuator by using only one button. Furthermore you can switch a channel with a long keystroke on and with a short keystroke off. For both objects, a function can be set individually. Therefore the sub-functions on, off, toggle and nothing are available. Two communication objects are displayed, which can be connected in any way. By activating the sub-function "toggle" an additional communication object appears, called "value for toggling". This object is a status object for the push button and must be connected to the status-object of the actuator (have a look at: 4.5.1 Toggle)

The following diagram shows the behavior of this parameter. Both objects (push-button and pushbutton long) were set to toggle. The object for the long keystroke is connected to channel A of the switch actuator and the object for the short keystroke is connected to channel B:

In this example the push button toggles Channel B with a short keystroke. The Channel A does not react to a short keystroke. This one reacts only at a long keystroke with toggling.

The following diagram shows a further application example for this parameter. In this example, the object for a long keystroke switches the channel A of a switch actuator on. A short keystroke switches the channel off. The three communication objects were connected in only one group address:

If the sub function "Send value" is selected, the following additional settings appear:

| Sub-function | Dynamic range <br> [default value] | comment |
| :---: | :---: | :--- |
| Value for keystroke short/long | Send value | chosen sub-function: Send value |
| Send value | 1 Byte-Value [0...255] <br> Scene number | Selection of the value, which shall <br> be sent |
| 1 Byte-Value [0...255] | $0-255$ <br> $[0]$ | Selection of the byte value, which <br> shall be sent if byte value is <br> chosen |
| Scene number | $1-64$ <br> $[1]$ | Selection of the scene number, <br> which shall be sent if scene <br> number is chosen |

Table 33: Sub function Send value at switch short/long

Any value can be sent for the sub function „Send value" at a short/long keystroke. As well scenes can be called as any byte value can be sent. So it is for example possible to call different scenes for a long and a short keystroke or sending absolute height/brightness commands.

### 4.5.4 One button dimming

At the dimming function for the single channels, the dimming process is proceeded by only one channel.

|  | Push button 3 |
| :--- | :--- |
| Function | One button dimming |
| Blocking object | not active |

Figure 15: Parameter one-button dimming

At the following chart, the sub functions for this parameter are shown:

| Sub-function | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Blocking object | - Inactive | have a look at 4.3.1 blocking <br> object |

Table 34: Sub function one-button dimming

The chart shows the available communcication objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Dimming on/off | 1 Bit | Switching function for the dimming process; <br> action for the short keystroke |
| 1 | Dimming | 4 Bit | dimming function; action for a long keystroke |
| 2 | Value for toggle | 1 Bit | status object, must be connected with the <br> status function of the actuator for getting <br> feedback of the current switching process |

Table 35: Communication objects one-button dimming

At the one-button dimming, the dimming process is executed by one single channel. So it is possible to dim the lights via only one button.
By a long keystroke the communication "Dimming" is called, which is responsible for the dimming process and by a short keystroke the object "Dimming on/off" is called which is responsible for the switching.
The dimming direction is toggled by every keystroke, so if you have dimmed darker, the next time will be dimmed brighter and vice versa.
The one-button dimmeing is a start stop dimming, that means when the dimming function is active a darker or brighter command is sent until the button is released again. After releasing the button a stop command is sent, which stops the dimming process. The dimming step is set fixed to $100 \%$. So with only one button activation the lights can be dimmed from $0 \%$ to $100 \%$ or from $100 \%$ to $0 \%$.

### 4.5.5 One-button Shutter

The shutter function for the unique channels, often called one-surface shutter, performs the shutterfunction by using only one channel.

Figure 16: Parameter one-surface shutter

The sub-functions for this parameter are shown in the chart below:

| Sub-function | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Blocking object | -Inactive | have a look at 4.3.1 blocking <br> object |

Table 36: Sub-functions one-surface shutter

The chart shows the communication objects for this parameter:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 0 | Shutter | 1 Bit | Driving function of the shutter, action for a <br> long keystroke |
| 1 | Blinds/Stop | 1 Bit | Stop/ Adjustment of blinds; action for a short <br> keystroke |
| 2 | Value for change of direction | 1 Bit | Shows the last driving command |

Table 37: Communication objects one-surface dimming

The one-surface dimming is performed by using only one channel. The communication object
"Shutter" is addressed by a long keystroke and performs the up- and down-movement of the shutter. The direction of movement depends to the last direction of movement. If the shutter were driven up at the last time, they will be driven down at the next time. So the direction of movement changes after every movement.
The communication object "Blinds/Stop" is addressed by a short keystroke. Addressing this object stops a running movement of the shutter. Furthermore it will adjust the blinds if a shutter function is selected for this channel. The direction of the adjustment changes also here after every movement in the same way like the up/down moving of the shutter.
It is also possible to switch the functions for the short and the long keystroke. So it can be chosen whether a short or a long keystroke shall drive the shutter/blinds. The Stop-/ Adjustment object gets the other operating concept.
The object "Value for change of direction" serves as state object. It must be connected to the direction object of the actuator. So the button sends always the complementary value as before.

### 4.6 Panic/Cleaning function

If at least 3 buttons are pressed simultaneously, the panic or the cleaning function is activated. At the push button settings, have a look at 4.2 Configuration, can be defined which function shall be called at a short keystroke of at least 3 buttons and which function shall be called at long keystroke of at least 3 buttons.
The cleaning function is only a blocking of all buttons for the fixed adjusted timeof 10 seconds. An active cleaning function is indicated by flashing of all white LEDs. The function allows an easy cleaning of the push button and avoids a function call during the cleaning process.

The panic function can generate an additional function call at the activation of at least 3 buttons. So function calls of central functions, like central on/off, forced settings can be generated or scenes can be called.

The following chart shows the menu for the panic buttons:

|  | Panic push button |
| :--- | :--- |
| Subfunction | Switch |
| Value for push | on |
| Blocking object |  |

Figure 17: Parameter Panic push button

Folgende Parametersind für die Paniktasten verfügbar:

| Function | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Sub-function | - Switch <br> - Toggle <br> - Send value | Sub-function for the panic function |
| At Switch: <br> Value for push | - On | At the sub function switch can be adjusted which value shall be sent |
| At send value: 1 Byte Value | $\begin{gathered} 0-255 \\ {[0]} \end{gathered}$ | If the sub function send value is adjusted as Byte value any value from 0-255 can be sent |
| At send value: <br> 2 Bit Value (Forced setting) | - forced setting not active <br> - forced setting ON <br> - forced setting OFF | If the sun function send value is adjusted as forced setting, the type of the forced setting can be adjusted |
| Blocking object | - Inactive <br> - Active | have a look at 4.3.1 blocking object |

Table 38: Parameter Panic button

An activated panic function is indicated by a light up of all red LEDs for a half second. The light behaviour is adjusted fixed and can not be changed of the user. The panic function calls at the activation the adjusted settings.
If at the call of the panic the function also the functions for the single buttons are called, the reaction time should be adjusted slower. This setting can be done at the menu button configuration (have a look at 4.2 Configuration).
An active cleaning function is indicated by a flashuing of all white LEDs at the rhythm 1:1 for the duration of the cleaning function. There are no further settings available for the cleaning function, because the cleaning function is only blocking of all buttons for the duration of 10 seconds.

### 4.7 Configuration of LED lights

The configuration of the LED lights is divided into the configuration, the general settings can be done at this menu, and the settings for each single LED per button.
The following illustration shows the menu Configuration of LED lights:

|  | Configuration of LED lights |
| :--- | :--- |
| Switching Day / Night | Day = 1 / Night = 0 |
| LED orientation light | on |
| LED Orientation brightness by day | brightness 5 |
| LED Orientation brightness by night | brightness 3 |
| Block object for LED | not active |
| Behaviour of LEDs at bus power up | No read LED objects |

Figure 18: Configuration of LED lights

The following parameters are for the LED-configuration available:

| ETS-Text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Switching Day/Night | - not active <br> - Day=1/Night=0 <br> - Day=0/Night=1 | Adjustment of the polarity of the day/night object |
| LED orientation light | - Off <br> - On <br> - over ext. object $0=0 f f$, 1=On <br> - over ext. object 1=Off, $0=0 n$ | Activation and adjustment of the orientation light |
| LED orientation by day | - Off <br> - Brightness 1-5 | Luminiscent behaviour of the orientation light at day |
| LED orientation by night | - Off <br> - Brightness 1-5 | Luminiscent behaviour of the orientation light at night |
| Blocking object for LED | - not active <br> - block button LEDs <br> - block orientation LED <br> - block all LEDs | Activation of the blocking object and adjustment which LEDs shall be blocked |
| Behavior of LEDs at bus power up | - Read LED objects <br> - No read all LED objects | activates the read of the LED objects at bus power up |

Table 39: Configuration LED lights

The parameters are explained at the following segments:

- Switching Day/Night

The day/night object is used for the brightness control of the LEDs. So it can be adjusted a brightness for every LED for daytime and for night. The polarity of the object can be adjused.

- LED orientation

The orientation light can be switched permanent on or off. Further more it can be activated or deactivated by an external object.

- Blocking object for LED

A common blocking object for all LEDs exists. This can be activated at this parameter and the blocking behaviour can be defined. The blocking behaviour for each single LED can be realized via the priority setting.

- Behavior of LEDs at bus power up

If the LED objects are read at a bus power up, these know instantly its current state. If the objects are not read, all LEDs are called at a bus power up with the settings for switched off.

### 4.7.1 LED 1 - 4 [8]

Every LED can be activated single and parameterized individually. This can be dona at the submenu for each LED:

| LED 1 |  |
| :--- | :--- |
| LED 1 (top left) active | yes |
| LED 1 reacts at: | external object and buttons activation |
| LED characterization by day (value ON) | white brightness 3 |
| LED characterization by day (value OFF) | bed brightness 3 |
| LED characterization by night (value ON) | whing |
| State brightness 3 |  |

Figure 19: Configuration LEDs per button

The following chart shows the available settings if the LED was activated:

| ETS-Text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| LED 1-4[8] reacts at | - external object <br> - internal object <br> - button activation <br> - external object and button activation <br> - internal object and button activation | Adjustment by what the LED shall be called |
| LED characterization by day (Value ON) | - off <br> - white, brightness 1-5 <br> - red, brightness 1-5 [white, brightness 3] | Luminiscent behaviour of the LED at day and value on |
| LED characterization by day (Value OFF) | - off <br> - white, brightness 1 - 5 <br> - red, brightness 1-5 | Luminiscent behaviour of the LED at day and value off |
| State of LED by day (Value ON) | - permanent <br> - blinking | defines the luminescent behaviour when the LED is switched on |

| LED characterization <br> by night (Value ON) | - off <br> - <br> white, brightness 1-5 <br> red, brightness 1-5 <br> [white, brightness 1] | Luminiscent behaviour of the LED <br> at night and value on |
| :--- | :--- | :--- | :--- |
| LED characterization <br> by night (Value OFF) | - off <br> - white, brightness 1-5 <br> - red, brightness 1-5 | Luminiscent behaviour of the LED <br> at night and value off |
| State of LED by night <br> (Value ON) | - permanent <br> - blinking | defines the luminescent <br> behaviour when the LED is <br> switched on |

Table 40: Parameter LED 1-4[8]

The LED activated as follows:

- external object

By the activation via an external object, an additional communication object is shown, which can be called from every device at the bus system.

- internal object

By activation via an internal object, the LED can be called from any available object of the push button. For this purpose an additonal window "Select of the object number" is shown in which the number of the calling object can be selected.

- button activation

The LED reacts standardly at the button activation. The value for one is called when the button is activated and the value for off when the button is not activated.

- external object and button activation

By this function it is possible to activate the LED via button activation and an external object. The settings for the LED characterization by value on and off refer to the external object. So the external object is preferential, because it has permanenet a value. At the button activation, the LED lights 2 steps brighter. If the LED is already at the highest brightness level, the LED will be switched off at button activation. A blinking LED is switched into the permanent mode.

- internal object und button activation

By this function it is possible to activate the LED via button activation and an internal object. The settings for the LED characterization by value on and off refer to the internal object. So the internal object is preferential, because it has permanenet a value. At the button activation, the LED lights 2 steps brighter. If the LED is already at the highest brightness level, the LED will be switched off at button activation. A blinking LED is switched into the permanent mode.

### 4.7.2 LED Prioritity

By using the LED priority fixed values can be generated and the LED can be locked for further activations.

The following illustration shows the LED priority:

| Priority LED 1 | activ if object LED priority value $=1$ |
| :--- | :--- |
| LED characterization by day | red brightness 4 |
| State of LED by day (value ON ) | permanent |
| LED characterization by night | red brightness 2 |
| State of LED by night (value ON ) | permanent |

Figure 20: Parameter LED Priority

The following chart shows the available settings, when the LED priority was activated:

| ETS-Text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Priority LED 1-4[8] | - not active <br> - active, if object LED priority value = 1 <br> - active, if object LED priority value $=0$ | Activation of the LED priority |
| LED characterization by day | - off <br> - white, brightness 1 - 5 <br> - red, brightness 1-5 [white, brightness 3] | Luminiscent behaviour of the LED at day when the priority is switched on |
| State of LED by day(value ON) | - permanent <br> - blinking | defines the luminescent behaviour when the LED is switched on |
| LED characterization by night | - off <br> - white, brightness 1-5 <br> - red, brightness 1-5 <br> [white, brightness 1] | Luminiscent behaviour of the LED at night when the priority is switched on |
| State of LED by night(value ON) | - permanent <br> - blinking | defines the luminescent behaviour when the LED is switched on |

Table 41: Parameter LED priority

The LED priority calls fixed adjusted brightness values for the corresponding LED and locks the LED for further activations. There is also at the LED priority a differentiation between day and night.

The following chart shows the communication objects for the LED lights:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| $37 / 57$ | LED $1-4[8]$ | 1 Bit | switches the LED on/off |
| $41 / 65$ | LED priority $1-4[8]$ | 1 Bit | switches the LED priority on/off |
| $45 / 73$ | LED orientation | 1 Bit | switches the orientation light on/off |
| $46 / 74$ | LED Block object | 1 Bit | activates the blocking function |
| $47 / 75$ | Day/Night | 1 Bit | Switchover between day and night |

Table 42: Communication objects LED lights

### 4.8. Logic

The push buttons contain of 4 individually switchable and parameterize able logic blocks. At the following page, the logic blocks can be activated and the general settings can be made:

|  | Settings for logic |
| :--- | :--- |
| Settings for logic 1 | disabled |
| Settings for logic 2 | disabled |
| Settings for logic 3 | disabled |
| Settings for logic 4 | And |
| Objecttype 4 | Switch |
| Sending condition | not automatic |
| Dutput inverted | no |

Figure 21: Activation logic functions

The following parameter can be adjusted once and is valid for all of the 4 logic blocks:

| Sub-function | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Behavior at bus power up | - no read ext. logic objects | sub-function indicates whether the <br> external logic objects should be read or <br> not at a bus power up |

Table 43: Common Parameter logic blocks

If the read of the external logic at bus power up is activated, the status of all external logic objects will be read at a bus power up. So the logic operation is evaluated new. If this function is not active, the push button will hold the status before bus power outage.

The Chart shows the setting options for the logic blocks. The logic blocks can be assigned a logic function and an object type, the usage of this logic block:

| Setting per logic <br> [default value] | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| - disabled | - Switch | Every logic block can be adjusted as And- or as <br> - And |
| Or |  |  |

Table 44: Dynamic range logic

The following chart shows the communication objects for the logic functions:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| $25 / 45$ | Logic input 1A | 1 Bit | Communication object for an external logic; is <br> only displayed when an external logic was <br> activated |
| $26 / 46$ | Logic input 1B | 1 Bit | the same like logic input 1A |
| $27 / 47$ | Logic Output 1 | 1 Bit | Output logic for switch is activated (=1-signal) <br> when the logic block is true |
| $27 / 47$ | Logic Output 1 Scene | 1 Byte | Output logic for scenes is activated (=1-signal) <br> when the logic block is true |

Table 45: Communication objects logic

The communication objects for the other 3 possible logic blocks are the same like the first one. Three numbers are reserved for every logic block, so the next logic block starts at number 83.

As soon as a logic block is activated, a new sub-menu appears at the left selection list. In this menu can be set, which buttons should be connected to the logic block. Two external logic blocks can be activated additional. The external logic objects can be connected to communication objects of other devices by using the displayed communication objects "logic input 1 A\&B".

|  | Logic $\mathbf{4}$ |
| :--- | :--- |
| Logical object 4 A (external) | disabled |
| Logical object 4 B (external) | disabled |
| Internal Input 1 | Push button 2 |
| Push button 2 | normaly active |

Figure 22: Setting logic

The read of the inputs (number depends to the device type) can be activated for every channel and two external objects. They can be read normal or inverted.

### 4.8.1 Logic sub-function switch

The chart shows the possible sub-functions for the logic sub-function switch:

| Sub-function | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Sending condition | - not automatic <br> change of input <br> change of output | Adjustment indicates, when the state of <br> the logic block should be sent |
| Output inverted | - No <br> - Yes | Adjustment indicates, whether the <br> output should be inverted or not |

Table 46: Logic sub-function switch
The sending condition adjusts, when the push button should send a signal on the bus. By adjusting the sending condition "change of input", the push button sends a signal at every change of any input whether that causes a change of the logic operation or not. The setting "change of output" causes that the push button sends only a signal when the logic changes its current status.
The sub-function Output inverted indicates whether the output signal should be issued inverted (that means reversed 1->0 and 0->1) or normal.
The following diagram shows the logic operation switch as an and-function. The logic reads in this example the channels $A$ and $B$ as well as an external logic object. The Output is inverted:

### 4.8.2 Logic sub function - Scene and Value

By using this logic sub-function scenes and byte values can be called.

The chart shows the available settings for the sub-function scene and value:

| Sub-function | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Scene number | $1-64$ <br> $[2]$ | Scene number must be the same like the <br> one you want to call with the logic- <br> function |
| 1 Byte Value | $0-255$ <br> $[0]$ | Adjustement which byte value shall be <br> sent when the logic function is true |

Table 47: Logic sub-function scene and value

The logic function for the scenes and values works like a normal logic function. As soon as the logic function is satisfied, the communication object will send the adjusted scene-number or byte value. The communication object has the length of 1 Byte, so that it can be connected to other communication objects of scenes.
All sub-functions, like in a normal logic function can be parameterized. So you can set the logic function as an AND- or an OR-function and connect all inputs of the push button and additional 2 external logic objects to the logic function.

### 4.9 Room Temperature (RF-GTTxx.01)

The integrated room temperature sensor can send the room temperature to temperature controllers. So, no additional temperature sensors must be used.

The following chart shows the menu for the room temperature sensor:

| Room temperature |  |  |
| :---: | :---: | :---: |
| Sensor room temperature | active | $\checkmark$ |
| Send temperature value cyclic | 2 min | $\bullet$ |
| Aligment value (Value * 0.1 K ] | 0 | $\stackrel{\square}{\square}$ |
| Send temperature at changes of | $0,3{ }^{\circ} \mathrm{C}$ | $\checkmark$ |
| Upper state value | $22^{\circ} \mathrm{C}$ | $\checkmark$ |
| Lower state value | $7^{\circ} \mathrm{C}$ | $\checkmark$ |

Figure 23: Room temperature sensor

The chart shows the availabale settings, when the room temperature was adjusted as active.

| ETS-Text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Send temperature value cyclic | - no send cyclic <br> - 1 min <br> - 2 min <br> - 3 min <br> - 5 min <br> - 10 min <br> - 15 min <br> - 20 min <br> - 30 min <br> - 60 min | Adjustment if the temperature value shall be sent cyclic and defining of the time step |
| Alignment value (Value * $0,1 \mathrm{~K})$ | $\begin{gathered} -50-50 \\ {[0]} \\ \hline \end{gathered}$ | The alignment value is for the increasedecrease of the measured value |
| Send tmeperatur value at changes of | $\begin{gathered} \text { no send, } 0,1^{\circ} \mathrm{C}-5^{\circ} \mathrm{C} \\ {\left[0,3^{\circ} \mathrm{C}\right]} \\ \hline \end{gathered}$ | Adjustment if the temperature value shall be sent at a determined change |
| Upper state value | not active, $20^{\circ} \mathrm{C}-40^{\circ} \mathrm{C}$ [22 ${ }^{\circ} \mathrm{C}$ ] | Determination of the upper reporting value |
| Lower state value | not active, $3^{\circ} \mathrm{C}-30^{\circ} \mathrm{C}$ [ $7^{\circ} \mathrm{C}$ ] | Determination of the lower reporting value |

[^6]The following settings are available:

- Send temperature value cyclic

The temperature value can be sent in fixed time steps. The cyclic send is independent from a change of the temperature value.

- Alignment value (Value * 0,1K)

The measured temperature value can be corrected by this setting. By choosing a negative value for this parameter, the measured value will be lowered and by choosing a positive value, the measured value will be lifted. The value is multiplied by $0,1 \mathrm{~K}$, so the current value can be lowered or lifted up to 5 K . This setting is useful, when the sensor was built at an unfavorable location, e.g. becoming draft or next to a window. When this function is activated, the temperature controller will also send the corrected values.
All sensors are matched in-plant to $0,1 \mathrm{~K}$.

- Send temperature at change of

By using this setting, the temperature can be sent at a determined absolute change.

- Lower/upper state value

If an upper/lower state value is adjusted, two additional 1Bit objects are shown. These send a 1-signal, when the temperature execeeds the upper state value or falls below the lower state vaue.

The following communication objects are available for the room temperature sensor:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 48 | Measurement | 2 Byte | sends the current temperature value |
| 49 | State maximum value | 1 Bit | sends a 1-signal, when the temperature <br> exceeds the adjusted value |
| 50 | Stae minimum value | 1 Bit | sends a 1-signal, when the temperature falls <br> below the adjusted value |

[^7]
## 5 Reference ETS-Parameter switching output

### 5.1 Channel selection

Every pair of channels can be selected as switch, staircase or shutter, blinds at the submenu outputs. If the pair of channels is selected as switch, staircase, every single channel can be parameterized as switch or staircase:

Figure 24: Channel selection

Further more the automatic objects can be achtivated in this menu. The automatic objects are for shutter output, which is described in 6 Reference ETS-Parameter - Shutter output.

### 5.2 Identical parameter

The following parameters, which are described at the headings 5.2.x, are as well available at channels selected as switch as at channels selected as staircase.

### 5.2.1 Relay operating mode

The following illustration shows the setting options for this parameter:

| Mode | normaly opened <br> normalu opened <br> normaly closed |
| :--- | :--- |

Figure 25: Operating mode

The following chart shows the dynamic range for this parameter:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| Mode | - normally opened <br> normally closed | Relay operating mode of the <br> channel |

Table 50: Operating mode

The following diagram shows the behavior of the relay operating mode normally closed and normally opened. The input for the channels is a KNX-telegram, which sends alternating 0 -signals and 1 -signals:

### 5.2.2 Central function

The following illustration shows the setting options at the ETS-Software:

| Central Function | not activ <br> not activ <br> activ |
| :--- | :--- |

Figure 26: Central function

The following chart shows the dynamic range for this parameter:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| Central function | - <br> - not active <br> active | switches the central function <br> on/off for this channel |

Table 51: Central function

The central function can be switched on/off for every channel. For switching on this function, you have to choose the option "active". By calling the central communication object, all channels with an activated central function are switched on with their current parameterization. So switch-on delays or staircase functions are still kept.
The central function can make programming much more easier and your project can become more clear.

The following chart shows the associated communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
|  | Central function | 1 Bit | central switching of the channels <br> number depends to the number of channels |

Table 52: Communication object central function

### 5.2.3 Behavior at block/unblock

The following illustration shows the setting options at the ETS-Software:

| Behaviour when locked | Off |
| :--- | :--- |
| Behaviour when unlocked | On |

Figure 27: Blocking function
The following chart shows the dynamic range for this parameter:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| Behavior when locked | -On | Behavior to a |
| Behavior when unlocked | - Off | blocking/unblocking process |

Table 53: Behavior at block/unblock

The blocking function gets active, when the corresponding communication object becomes a logical " 1 ". By sending a logical " 0 ", the blocking function can be deactivated again.
The parameter "Behavior when locked" defines an action for the output at activating the blocking process. There are the setting on, off and no change available. The same settings are also available for the "Behavior when unlocked". This action is called when the blocking function is deactivated again.

The following chart shows the corresponding communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 87 | Block | 1 Bit | blocks the channel |

Table 54: Communication object blocking function
The following diagram describes the blocking process. For the "Behavior when locked", the action on was parameterized and for the "Behavior when unlocked" the action off was parameterized:

The KNX telegram shows which values are send to the blocking object. By sending a logical " 1 ", the blocking function is activated and the channel is switched on. The blocking function is deactivated again by sending a logical " 0 ". So the channel is switched off.

### 5.3 Switching output

The following parameters, which are described at the headings 4.4.x, are only available at channels selected as switch.

### 5.3.1 Overview

By choosing a channel as switch, a sub menu, called Channel A Switching, appears for this channel at the left drop down menu.
The sub menu is shown at the following illustration:

| Mode | normaly opend |
| :--- | :--- |
| On delay [s] | 0 |
| Off delay [s] | 0 |
| Send cyclic current value [s] | 0 |
| Behaviour when locked | no change |
| Behaviour when unlocked | no change |
| Central function | not active |
| Logical functions | not active |
| Scene |  |

Figure 28: Switching output

The chart shows the possible settings for switching outputs:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Mode | - normally opened <br> - normally closed | Operation mode of the channel |
| On-Delay | $0 . . .30000 \mathrm{sec}$ [ $0=$ no delay] | Switch on delay of the channel in seconds |
| Off-Delay | $\begin{aligned} & 0 . . .30000 \mathrm{sec} \\ & {[0=\text { no delay]] }} \end{aligned}$ | Switch off delay of the channel in seconds |
| Central function | - not active <br> - active | Activates the central function for this channel |
| Behavior when locked | - Off <br> - On <br> - no change | Action for activating the blocking process |
| Behavior when unlocked | - Off <br> - On <br> - no change | Action for deactivating the blocking process |
| Logic function | - not active <br> - with one object <br> - with two objects | Activation of the logic function with one or two objects |
| Logic operation | - And <br> - Or | Selection of the logic function only available, when the logic function was activated |
| Scene | - not active <br> - active | Activation of the scene function by activation this parameter a new sub menu appears (have a look at 4.4.4) |

[^8]
### 5.3.2 On-/Off-delay

The following illustration shows the setting options at the ETS-Software:

| On Delay [s] | 0 | $\Delta$ |
| :--- | :--- | :--- |
| Off Delay [s] | 0 | $\Delta$ |

Table 56: On/Off delay

The on-delay causes a delayed switch of the channel. At sending an on-signal to the channel, first the adjusted on delay time expires and afterwards the channel will be switched on.
The off delay works on the same principle. At sending an off-signal, first the adjusted off delay time expires and afterwards the channel will be switched off.
Both functions work as well alone as combined. By adjusting " 0 seconds" for a delay the function is switched off.
The following diagram describes the combination of on and off delay:

### 5.3.3 Logical functions

The following illustration shows the setting options at the ETS-Software:

| Logical functions | with two Objects |
| :--- | :--- |
| logic Operations | OR |
|  | OR |

Figure 29: Logical functions

The logic function can be activated with one or two objects. The objects are the inputs of the logic block. Furthermore you can choose between an AND-function and an OR-function. When you have activated the logic function, the logic block has to be satisfied before switching the channel. As long as the logic function is not satisfied, the channel does not react to any signal.

The following chart shows the relevant communication objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 90 | Logic 1 | 1 Bit | Logic object 1, is the first input for the logic <br> block |
| 91 | Logic 2 | 1 Bit | Logic object 2, is the second input for the logic <br> block |

Table 57: Communication objects logic

According to the chosen logic operation only one or both objects have to become a 1-signal. The following chart shows the both logic operations with two objects:

## AND-Connection

| Logic 1 | Logic 2 | Channel <br> switchable? |  | Logic 1 | Logic 2 | Channel <br> switchable? |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | No |  | 0 | 0 | No |
| 0 | 1 | No |  | 0 | 1 | Yes |
| 1 | 0 | No |  | 1 | 0 | Yes |
| 1 | 1 | Yes |  | 1 | 1 | Yes |

Table 58: Logic operations

### 5.3.4 Scene function

When functions of different groups (e.g. light, heating and shutter) shall be changed simultaneously with only one keystroke, it is practical to use the scene function. By calling a scene, you can switch the lights to a specific value, drive the shutter to an absolute position, switch the heating to the day mode and switch the power supply of the sockets on. The telegrams of these functions can have as well different formats as different values with different meaning (e.g. " 0 " for switch the lights off and open the shutters). If there were no scene function, you would have to send a single telegram for every actuator to get the same function.
The scene function of the switch actuator enables you to connect the channels of the switch actuator to a scene control. For that, you have to assign the value to the appropriated space (scene A..H). It is possible to program up to 8 scenes per switching output. When you activate the scene function at the switching output, a new sub menu for the scenes appears at the left drop down menu. There are settings to activate single scenes, set values and scene numbers and switch the memory function on/off at this sub menu.
Scenes are activated by receiving their scene numbers at the communication object for the scenes. If the memory function of the scenes is activated, the current value of the channel will be saved at the called scene number.
The communication objects of the scenes have always the length of 1 byte.

The following illustration shows the setting options at the ETS-Software for activating the scene function:

Figure 30: Scene function

The following chart shows the relevant communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 88 | Scene | 1 Byte | Call of the scene |

Table 59: Communication object scene
For calling a certain scene, you have to send the value for the scene to the communication object. The value of the scene number is always one number less than the adjusted scene number. For calling scene 1 , you have to send a " 0 ". So the scene numbers have the numbers from 1 to 64 , but the values for the scenes only from 0 to 63.
If you want to call scenes by a binary input or another KNX device, you have to set the same number at the calling device as at the receiving device. The calling device, e.g. a binary input, sends automatically the right value for calling the scene.

There are up to 8 storage options for scenes at every channel.
These 8 storage options can get any of the possible 64 scene numbers.

| Channel A. Scene |  |
| :---: | :---: |
| Save scene | enabled |
| Scene A | Off |
| Scene Number A | 1 - |
| Scene B | Off |
| Scene Number B | $2$ |
| Scene C | Off |
| Scene Number C | $3$ |
| Scene D | Off |
| Scene Number D | $4$ |
| Scene E | Off |
| Scene Number E | $5$ |
| Scene F | Off |
| Scene Number $F$ | $6$ |
| Scene G | Off |
| Scene Number G | $7$ |
| Scene H | Off |
| Scene Number H | $8$ |

Figure 31: Sub function scene

The chart shows the possible settings for scenes, which are identical for all channels. The settings are available at the sub menu for the scenes:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Save scene | - disabled <br> - enabled | Learning of scenarios; enable/disable memory function |
| Scene A | $\begin{aligned} & \text { - Off } \\ & \text { - On } \end{aligned}$ | Activation of the scene A |
| Scene number A | $\begin{gathered} \hline \text { 1-64 } \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |
| Scene B | $\begin{array}{r} \hline \text { Off } \\ \text { - On } \\ \hline \end{array}$ | Activation of the scene B |
| Scene number B | $\begin{gathered} \hline \text { 1-64 } \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |
| Scene C | $\begin{array}{r} \hline \text { Off } \\ \text { - On } \\ \hline \end{array}$ | Activation of the scene C |
| Scene number C | $\begin{gathered} \text { 1-64 } \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |
| Scene D | $\begin{aligned} & \text { - Off } \\ & \text { - On } \end{aligned}$ | Activation of the scene D |
| Scene number D | $\begin{gathered} \hline 1-64 \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |
| Scene E | $\begin{aligned} & \text { Off } \\ & \text { - On } \end{aligned}$ | Activation of the scene E |
| Scene number E | $\begin{gathered} 1-64 \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |
| Scene F | $\begin{array}{r} \hline \text { - Off } \\ \text { - On } \\ \hline \end{array}$ | Activation of the scene F |
| Scene number F | $\begin{gathered} \hline \text { 1-64 } \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |
| Scene G | $\begin{aligned} & \text { - Off } \\ & \text { - On } \end{aligned}$ | Activation of the scene G |
| Scene number G | $\begin{gathered} \hline \text { 1-64 } \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |
| Scene H | $\begin{aligned} & \hline \text { - Off } \\ & \text { - On } \\ & \hline \end{aligned}$ | Activation of the scene H |
| Scene number H | $\begin{gathered} 1-64 \\ {[1]} \\ \hline \end{gathered}$ | Scene number; Calling value $=1$ less than the adjusted scene number |

Table 60: Parameter scene

## Technical Manual Glass Push Buttons RF-GTXX. 01

For calling a scene or saving a new value for the scene, you have to send the accordingly code to the relevant communication object for the scene:

| Scene | Retrieve |  | Save |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Hex. | Dez. | Hex. | Dez. |
| 1 | 0x00 | 0 | 0x80 | 128 |
| 2 | $0 \times 01$ | 1 | 0x81 | 129 |
| 3 | $0 \times 02$ | 2 | 0x82 | 130 |
| 4 | $0 \times 03$ | 3 | 0x83 | 131 |
| 5 | $0 \times 04$ | 4 | 0x84 | 132 |
| 6 | $0 \times 05$ | 5 | 0x85 | 133 |
| 7 | $0 \times 06$ | 6 | $0 \times 86$ | 134 |
| 8 | $0 \times 07$ | 7 | 0x87 | 135 |
| 9 | $0 \times 08$ | 8 | 0x88 | 136 |
| 10 | $0 \times 09$ | 9 | 0x89 | 137 |
| 11 | $0 \times 0 \mathrm{~A}$ | 10 | 0x8A | 138 |
| 12 | OxOB | 11 | 0x8B | 139 |
| 13 | 0xOC | 12 | 0x8C | 140 |
| 14 | 0x0D | 13 | 0x8D | 141 |
| 15 | OxOE | 14 | 0x8E | 142 |
| 16 | 0x0F | 15 | 0x8F | 143 |
| 17 | $0 \times 10$ | 16 | $0 \times 90$ | 144 |
| 18 | $0 \times 11$ | 17 | $0 \times 91$ | 145 |
| 19 | $0 \times 12$ | 18 | $0 \times 92$ | 146 |
| 20 | $0 \times 13$ | 19 | $0 \times 93$ | 147 |
| 21 | 0x14 | 20 | 0x94 | 148 |
| 22 | $0 \times 15$ | 21 | 0x95 | 149 |

Table 61: Calling and saving scenes

### 4.4.4.1 Scene programming example

When the scene function is activated for one channel, a new sub menu for the scene of this channel appears. Up to 8 scenes can be adjusted at this sub menu. Every scene gets one scene number, which enables the calling of the scene. You can adjust one specific state for every scene. So you can switch the channel off, with the setting "Off" or switch the channel on with the setting "On". When the scene is called, the adjusted parameterization of the channel is kept (e.g. on delay, off delay, ...). To note at the scene programming is that if you want to call 2 or more channels with the same scene number, you have to set the both communication objects for the scenes to the same group address. By sending the calling value, both scenes are called. Your programming can become much clearer if you divide your group addresses by scene numbers. If now one channel shall react to 8 scenes, you will have to connect the communication object for the scenes to 8 group addresses.
The following illustrations shall make the division clearly:

Figure 32: Programming of scenes

The channels A and D shall react to the call of scene A and scene B. So they are connected to both group addresses.

Furthermore you can save scenes at the according scene numbers. For that you have to activate the memory function at a channel of the switch actuator. Now you can call scenes by a binary input with a short keystroke and save scenes by a long keystroke. The adjusted value for the scene is overwritten by the current state of the actuator, when you save the scenes. At the next call of the scene, the scene will be called with the new value.

### 5.4 Staircase

The following parameters, which are described at the headings 4.5.x, are only available at channels selected as staircase.

### 5.4.1 Overview

By choosing a channel as staircase, a sub menu, called Channel A Staircase, appears for this channel at the left drop down menu.
The sub menu is shown at the following illustration:

| Mode | normaly ope | - |
| :---: | :---: | :---: |
| Time for Staircase lighting [s] | 120 | $\pm$ |
| Prewarning | not active | - |
| Manual switching off | not active | - |
| Extend Staircase lighting time | not active | - |
| Send cyclic current value [s] | 0 | $\pm$ |
| Behaviour when locked | no change | - |
| Behaviour when unlocked | no change | - |
| Central function | not active | * |

Figure 33: Staircase

## Technical Manual Glass Push Buttons RF-GTXX. 01

technologies

The chart shows all possible settings for staircase outputs:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Mode | - normally opened <br> - normally closed | Operation mode of the channel |
| Time for staircase [s] | $\begin{gathered} 0 . . .65535 \mathrm{sec} \\ {[120 \mathrm{sec}]} \\ \hline \end{gathered}$ | Duration of the switching process |
| Prewarning | - not active <br> - active | Activates the prewarning function |
| Warning time [s] | $\begin{gathered} \hline 0 . . .65535 \mathrm{sec} \\ {[120 \mathrm{sec}]} \\ \hline \end{gathered}$ | Duration of the warning; <br> Only available when warning is activated |
| Prewarning time [s] | $\begin{gathered} 0 \ldots 65535 \mathrm{sec} \\ {[120 \mathrm{sec}]} \end{gathered}$ | Adjustment, how long the light shall be switched on after the warning; Whole duration of the warning process is the sum of the 3 times: Staircase time, warning and prewarning Only available when warning is activated |
| Manual switching off | - not active <br> - active | Activation of the manual turn off of the staircase |
| Extend staircase time | - not active <br> - active | Activation of the extension of the staircase |
| Central function | - not active <br> - active | Activates the central function for this channel |
| Behavior when locked | - Off <br> - On <br> - no change | Action for activating the blocking process |
| Behavior when unlocked | - Off <br> - On <br> - no change | Action for deactivating the blocking process |

Table 62: Parameter staircase

### 5.4.2 Staircase time

The following illustration shows the setting options at the ETS-Software:

| Channel F Staircase |  |  |
| :--- | :--- | :--- |
| Mode | normaly opened |  |
| Time for Staircase [s] | 120 | not activ |
| Prewarning |  |  |

Figure 34: Staircase time

The staircase function is activated by choosing a channel as staircase. This function enables an automatic turn off of the channel after an adjusted time, called "time for staircase". The time for staircase can be parameterized freely. By sending an "on-signal" at the communication object, the channel is switched on and the time runs out. After the time is ran out, the channel is switched off automatically. There are a lot of further functions to adjust the staircase function. These functions are described at the following segments.

The following chart shows the relevant communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 86 | Staircase | 1 Bit | Calling of the staircase function |

Table 63: Communication object staircase

### 5.4.3 Prewarning und Warning

The following illustration shows the setting options at the ETS-Software:

| Prewarning | activ | - |
| :---: | :---: | :---: |
| Warning Time [s] | 11 | - |
| Prewarning Time in [s] | 10 | $\stackrel{\square}{\square}$ |

Figure 35: Warning timer \& prewarning time

The warning function can be activated by adjusting the parameter "Prewarning" as active. Now, you can adjust warning time and prewarning time.
The warning function is for warning that the staircase time ran almost out and the lights are switched off soon. This warning happens trough a short turn off the lights. The duration of the turn off is indicated by the warning time. A value of $1-3 \mathrm{~s}$ is advisable for this parameter. When the warning time runs out, the lights will be switched on again for the adjusted prewarning time. Now you have the opportunities to extend the staircase time, when this parameter was activated, or leave the staircase. A dynamic programming is advisable for this time. So you can adapt this time to spatial conditions (next switch, length of the staircase, etc.).
The whole duration of the switching process is the sum of the 3 times. The following diagram shall make this clear:

## Technical Manual Glass Push Buttons RF-GTXX. 01

### 5.4.4 Manual switch off

The following illustration shows the setting options at the ETS-Software:

| Manual Switch off | not activ <br> not activ <br> activ |
| :--- | :--- |

Figure 36: Manual switch off

By activation this function, you can switch the channel off before the staircase time runs out. For switching off the channel, you have to send a logical " 0 " to the communication object for switching the staircase function (have a look atTable 63: Communication object staircase). When this function is not activated, the channel switches only off after the staircase time runs out.

### 5.4.5 Extend staircase time

The following illustration shows the setting options at the ETS-Software:

| Extend Staircase time | not activ <br> not activ <br> activ |
| :--- | :--- |

Figure 37: Extend staircase time
By activating this function, the staircase time is retriggerable. That means, when the staircase time runs already out to $2 / 3$, you can restart the time by sending a new on-signal to the communication object of the staircase function (have a look atTable 63: Communication object staircase).
The following diagram shows the behavior of this parameter:

## 6 Reference ETS-Parameter - Shutter output

## Attention:

After every transmission of a new parameterization you have to move the Shutter/Blinds once completely down and up, thereby the Shutter actuator knows his actual Reference values (see also 6.3.1 Driving to reference).

### 6.1 Channel Selection

Every pair of channels can be selected as switch, staircase or shutter, blinds at the submenu outputs. If the pair of channels is selected as shutter, blinds, the pair of channels can be parameterized as shutter or blinds:

| Channel A / B | Switch, Staircase lighting |
| :--- | :--- |
| Function Channel A | Switch output |
| Function Channel B | Staircase lighting |
| Channel C / D | Shutter, Blinds |
| Function Channel C / D | Blinds |
| Objects for automatic position | not active |

Figure 38: Channel selection
Further more the activation of the automatic objects can be done in this menu. The automatic objects are needed for the automatic function, which is described at 6.6 Automatic function.

### 6.1.1 Shutter

If a channel is selected as shutter the user has a wide range of opportunities to parameterize the channel. These one are expounded at the following segments.
As soon as the channel is selected as shutters standardly three communications objects appear. The following chart shows these objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 85 | Shutter up/down | 1 Bit | Movement of the shutter |
| 86 | Blinds up/down/stop | 1 Bit | Adjustment of the blinds/ Stopping of the <br> shutter movement |

Table 64: Communication objects shutter

The communication object "Shutter up/down" is used to move the shutter. Thereby is to consider that a logical " 0 " starts the up-movement and a logical " 1 " starts the down-movement. This configuration is standardly defined by KNX and controls an identical communication between KNX devices.
The communication object "Blinds up/down/stop" is used to adjust the blinds. By calling this object the current movement of the shutter is simultaneous stopped.

### 6.1.2 Blinds

There are also a wide range of opportunities to parameterize the channel at blind function. The shutter function and the blind function are almost identical, but there are no options to parameterize or move the blinds at the blind function.
As soon as the channel is selected as shutters appears standardly three communications objects.
The following chart shows these objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 85 | Shutter up/down | 1 Bit | Movement of the shutter |
| 86 | Short time operation | 1 Bit | starts the short time operation |
| 87 | Stop | 1 Bit | Stopping the shutter movement |

Table 65: Communication objects blinds
The communication object "shutter up/down" is used to move the shutter. Thereby is to consider that a logical " 0 " starts the up-movement and a logical " 1 " starts the down-movement.
The communication object "Stop" is used to stop the current movement of the shutters. The object stop can be called by a logical " 0 " or " 1 ".

### 6.2 Time for movement

By setting different times for movement the user is able to parameterize the Actuator individually for almost every shutter/blind. To be sure that the movement function works properly, you have to parameterize these times carefully. If the channel is selected as shutter there are additional settings for the moving time of the blinds.
You can see the screen for setting these times in the following illustration:

| Channel B: Shutter |  |  |
| :---: | :---: | :---: |
| Time for movement for Up/Down (sec) | same | - |
| Time for movement (sec) | 10 | - |
| Extension of time for movement | 10\% | - |
| Step time for blinds (ms) | 1000 | $\checkmark$ |
| Duration of blinds adjustment (ms) | 5000 | - |
| Pause at change of direction (ms) | 1000 | $\square$ |
| Switch-on delay motor (ms) | 0 | $\stackrel{\square}{\square}$ |
| Switch-off delay motor (ms) | 0 | $\square$ |
| Position of blinds at end of driving | 100\% | $\bullet$ |

Figure 39: Time for movement Shutter

|  | Channel B: Blinds |
| :--- | :--- |
| Time for movement for $\mathrm{Up} / \mathrm{Down}(\mathrm{sec}$ ) | same |
| Time for movement (sec) | 10 |
| Extension of time for movement | $20 \%$ |
| Short time operation | 100 |
| Pause at change of direction (ms) | 0 |
| Switch-on delay motor (ms) | 0 |
| Switch-off delay motor (ms) | not activ |

Figure 40: Time for movement Blinds

In the following chart, you can see the setting range for the movement times:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Time for movement up/down | - same <br> - different | Adjustment, whether up-and downmovement should be different or not |
| Time for movement Time for movement up/down | $\begin{gathered} 1-10000 \mathrm{sec} \\ {[45 \mathrm{sec}]} \\ \hline \end{gathered}$ | sets the duration for an up-/downmovement |
| Extension of time for movement | $\begin{gathered} \text { no extension, } 2 \%, 5 \%, 10 \%, \\ 15 \%, 20 \% \end{gathered}$ | The extension of movement is for the definitely driving to the end stop and has no effects to the calculation of the absolute positions. |
| Step time for slats | $\begin{gathered} \text { 50-1000ms } \\ {[200 \mathrm{~ms}]} \end{gathered}$ | only at shutter Duration for a step at the adjustment of blinds |
| Duration of slat adjustment | $\begin{gathered} \text { 10-10000ms } \\ {[1200 \mathrm{~ms}]} \end{gathered}$ | only at shutter <br> Duration for the whole adjustment of blinds (0-100\%) |
| Pause at change of direction | 1-1000ms [500ms] | sets the pause time between an upand down movement |
| Switch-on delay motor | $\begin{gathered} 0-255 \mathrm{~ms} \\ {[0 \mathrm{~ms}]} \end{gathered}$ | switch-on delay for motors, which have not the whole power at the beginning |
| Switch-off delay motor | $\begin{gathered} 0-255 \mathrm{~ms} \\ {[0 \mathrm{~ms}]} \end{gathered}$ | switch-off delay for motors, which have time lag after set off |
| Position of blinds at end of driving | $\begin{gathered} 0-100 \% \\ {[50 \%]} \end{gathered}$ | only at shutter sets the position of blinds after driving the shutter |
| Short time operation | - not active <br> - active | only at blinds sets the short time operation on/off |
| Time for movement for short time operation | $\begin{gathered} \text { 50-1000ms } \\ \text { [200ms] } \end{gathered}$ | only at blinds adjusts the time for one short time operation |

Table 66: Dynamic range time for movement

The functions are described in detail at the following segments.

### 6.2.1 Measurement of times for Movement

The individual times for the movement of shutter/blinds can normally determined very precise by using a stop watch.
If there are very short times for the movement, the measuring by using a watch will maybe cause problems. In this case it is advisable to adjust initially an approximated value, which should be a little bit shorter than the real time for movement. Afterwards you can test the adjusted time by triggering the shutters or blinds and control whether the final positions are achieved. If they are not achieved, you should set the time for movement gradually higher by using small steps until the final positions are achieved.

### 6.2.2 Movement time

The movement time describes the time which the shutter actuator needs to drive the shutter/blinds from one final position to the other. When the adjusted time is over the channel is set off even when the final position was not achieved. So the shutter actuator triggers the down-movement/ upmovement for the adjusted time.
Because shutters and blinds have often different times for the up down movement, different times can be adjusted for the up and down movement (from hardware version 2.2).
The extension of time for movement (from hardware version 2.2) guarantees the definitely driving to the end stops. This function has no effects to the calculation of the absolute positions. So you should always adjust the precise time for the movement time and activate the extension for the guaranted driving to the end stops.
Check if the manufactory gives any data for the movement times.

### 6.2.3 Step time for blinds

## $\rightarrow$ only at blinds

You can adjust in which steps the blinds shall be shifted with the setting "step time for blinds". The opening angle can adjust thereby in small steps to prevent e.g. a glare of the sun after a changing of the solar altitude or tighten sunblinds.
Additional, it is possible to adjust the step range in a way so that the blinds drive from one final position to the other in a specific number of steps. For this way of blind-movement, you have to set the step time for blinds to a multiple of the "duration of blinds adjustment". Thereby the multiple of the duration time specifies the number of steps, which are required to drive the blinds from one final position to the other.
For Example: Duration of blind adjustment: 3000ms
Step time for blinds $=300 \mathrm{~ms}$
$\rightarrow$ Number of steps=10 $\rightarrow$ therefore the values $0 \%, 10 \%, \ldots, 100 \%$ can be appointed

### 6.2.4 Duration of blind adjustment <br> \section*{$\rightarrow$ only at blinds}

The duration of blind adjustment sets the interval, which is required to drive the blinds from $0 \%$ to $100 \%$ or backwards. Therefore the shutter actuator triggers the blind adjustment.

Tip for the measurement from very small durations of blind adjustment

- Drive the blinds in a final position (either $100 \%$ closed or $100 \%$ opened)
- Now send step commands until the other final position is achieved
- Multiply the number of steps with the adjusted time for the step time of blinds
- Enter the result to the "duration of blind adjustment"

It is advisable to use the procedure, like under 6.2.1 Measurement of times for Movement described, by long blind adjustment times.

### 6.2.5 Pause at change of direction

The pause at change of direction is for the protection of the shutter motor, if the shutter actuator receives simultaneously commands for the up- and down-movement. A direct shift from the one to the other direction can contract the duration of the motor significantly and even by some motors a total damage is caused.
If the shutter actuator receives during a running movement a command for a movement to the other direction, the shutter actuator will switch off the movement. Before the shutter actuator switches the movement to the other direction on, the actuator stops for the adjusted time for the pause at change of direction.
The pause at change of direction counts as well for the change of direction of the up-/downmovement as for the blind adjustment.

$\triangle$
Too short adjusted pause at change of direction can cause damages of the motor! Notice the manufacturer's data at the datasheet of the drive absolutely.

### 6.2.6 Switch-on/Switch-off delay motor

Some motors can not bring the full power at the moment of switching it on, but first after some milliseconds. The time, which the motor needs to get the full power, can be balanced with the adjustment of the switch-on delay of the motor.
On the other hand there are motors, which run after it was switched off. This characteristic can be balanced by using the setting switch-off delay motor.

### 6.2.7 Position of blinds at end of driving

## $\rightarrow$ only at blinds

By using the adjustment "position of blinds at end of driving" can be adjusted in which position the blinds shall be set after a down- or an up-movement. The shutter actuator drives automatically to this position after the end of a blind-movement. The position of blinds at end of driving can be set percentage in $1 \%$ steps, from $0 \%$ to $100 \%$, whereby $0 \%$ full opened and $100 \%$ full closed correspond.

### 6.2.8 Short time operation

## $\rightarrow$ only at blinds

The short time operation helps you to drive the blinds to a certain position, e.g. for sun protection. With small steps, the blinds can be driven to every possible position. It is often useful to set the short time operation as a multiple of the movement time. So the blinds can be driven from the bottom to the top, or the other way around, in a certain number of steps.

### 6.3 Objects for absolute position/ Status objects

Through activating the objects for absolute position it is possible to drive to absolute positions for movement and blind positions.
The following illustration shows the possible settings:

Figure 41: Objects absolute position

The following chart shows the setting range for this parameter:

| ETS-text | Dynamic range <br> [default value] | comment |  |
| :--- | :--- | :--- | :--- |
| Objects for absolute position | - | not active <br> active | activate/deactivate the objects for <br> absolute position |
| Reaction after driving to <br> reference | - | no reaction <br> drive to former <br> position | gets only displayed if the objects <br> are activated; <br> sets the reaction after a driving to <br> reference |
| Status objects | -not active <br> active | enables the status objects |  |
| Status object for visualization | - | Status actual direction |  |

Table 67: Setting range absolute position

When the objects for the absolute position are activated, the following objects aredisplayed:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 89 | Status actual direction | 1 Bit | indicates the actual direction of the way of <br> driving |
| 89 | Status of movement | 1 Bit | indicates an active driving process |
| 90 | absolute position | 1 Byte | utilized for driving the shutter/blinds to a specific <br> value |
| 91 | absolute position of slats | 1 Byte | for adjustment of the blinds to a specific value <br> (only at shutter) |
| 92 | Status actual position | 1 Byte | indicates the actual shutter-/blinds position <br> 93 Status act. position of slats |
| 94 Byte | indicates the actual position of the blinds (only at <br> shutter) |  |  |
| 94 | act. position valid | 1 Bit | indicates whether a driving to reference was <br> already conducted |

| 95 | start driving to reference | 1 Bit | starts the driving to reference |
| :--- | :--- | :--- | :--- |
| 97 | state upper position | 1 Bit | notify achievement of the upper end position |
| 98 | state lower position | 1 Bit | notify achievement of the lower end position |

Table 68: Communication objects absolute position

The usage/function of this communication objects are explained at the following segments.

### 6.3.1 Driving to reference

The shutter actuator calculates its actual positions from the appointed times for movement. The real times for movement can be corrupted trough outside influences after some time.
A driving to reference calculates the appointed time for movements anew and specifies in this way the shutter actuator new times for movement. Based on these new times for movement the shutter actuator can calculate the real position of the shutter/blinds more detailed.
The driving to reference is especially useful if someone works very often with commands for absolute positions. Therefore the shutter actuator can calculate the entered position more detailed and drive to this position more precise. Every drive to the lowest or highest position replaces a driving to reference. So the driving to reference should be done, when the shutter/blinds is only driven with absolute commands lower than $100 \%$ and more than $0 \%$. In this case, a reference drive should be done regularly, e.g. one's a week.
The reference run is started through an 1-signal on its 1 bit communication object "start driving to reference". It is possible to adjust the reaction after the driving to reference by the parameter "reaction after driving to reference". The shutter actuator can drive to the position, which it had before the reference run, by the setting "drive to former position". Through the setting "no reaction" the shutter actuator lets the shutter/blinds at the position, which was reached after the end of the reference run.
After every transfer of a new parameterization you have to conduct a reference run. This can either manual occurred, that means the upper and lower position are approached ones, or by the object "start driving to reference". Now the reference run was conducted and the shutter actuator knows its actual state along the driving range.

### 6.3.2 Commands for absolute positions

By the objects for absolute positions you can specify a constant value to the shutter actuator, on which the shutter shall be driven. This value is indicated in percent and has a range from 0-100\% with every $1 \%$ step between it. From the indicated percent value the shutter actuator calculates at the next step the real time for the movement of the shutter/blinds based on the appointed times for movement and the actual position.
The commands for the absolute position are transmitted to the 1 byte communication objects. There is an object for the absolute height positions of the driving way at shutter and blinds. Additional there is an object for the opening angle of the blinds at shutters, the object "absolute position of slats".
At the percentage description corresponds 0\% always fully opened and 100\% full closed.

### 6.3.3 Status objects (actual position/direction)

The status objects "Status actual position" and "Status act. position of blinds" conduce the visualization of the absolute position. Both objects indicate the actual state of the height and the opening angle of the blinds, respectively after end of driving. The objects can be used e.g. for Visualization.

### 6.3.4 Report objects

The 1 bit objects „state lower position" and „state upper position" will conduct respectively an 1signal, if the lower end position or the upper end position is achieved. The signal of the object changes from 1 to 0 , when the end position is left. Both objects are useful for the observation of the shutter/blinds.

### 6.3.5 Status objects for Visualization

The 1 bit status object "Status of movement" shows, that a movement of these shutters/blinds is active right now. A running movement is indicated by a logical " 1 ".
The 1 bit object "Status act. direction" conducts with a logical 0 a running up driving and with a logical 1 a running down driving. The state is respectively displayed, when a movement starts. The state exists intern as long as a new command for driving is sent. The 1 bit object "act. Position valid" will conduct, if a reference run was started after a new programming. This object can be used through a visualization to indicate that there is still a reference run necessary.

### 6.4 Drive to absolute position via 1 Bit

The following figure shows the available settings for the position start up via 1 Bit:

| Drive to absolute position via 1 Bit object | active |
| :--- | :--- |
| Action at value $=1$ | Drive to position |
| Position of Blinds | $50 \%$ |
| Position of slats | $100 \%$ |
| Action at value $=0$ | no function |

Figure 42: Position start up via 1Bit object

The following chart shows the dynamic range for this parameter:

| ETS-text | Dynamic range [default value] | comment |
| :---: | :---: | :---: |
| Function object number 24 | Position start up via 1Bit object | selected function for object number 24 |
| Action at value $=1$ | - Drive to position <br> - Drive to position if blind/shutter is up <br> - Drive to position if blind/shutter is down | Function for sending a logical 1 |
| Position of blinds/shutter/slats | $\begin{gathered} 0-100 \% \\ {[50 \%]} \end{gathered}$ | Position, which shall be activated at sending a logical 1 |
| Action at value $=0$ | - no function <br> - move up <br> - move down | Action at the deactivation of the position start up, via logical 0 |

Table 69: Position start up via 1Bit object

The function position start up via 1 Bit object enables driving to absolute positions via 1 Bit object. On this, additional conditions can be parameterized when the channel shall drive to the adjusted functions. Compared to the automatic function, this function is only valid for one single channel. So this function can be parameterized individually for every channel.
The parameter "Action at value $=1$ " defines whether the position start up shall occur in every position or only at the end positions.
Furthermore, it can be selected via the "Action at value 0 " what shall be happen at the deactivation of the position start up. The channel can drive to one of the both end positions or stay in its last position.
The "Action at value $=0$ " will only be done, if the current position is still the same as the adjusted one. If the shutter/blinds are driven to another position before sending a logical 0 , the channel will not drive.

The field of application for this function are widespread. Two examples are given at the following segments:

- Moving up the blinds for air ventilation at opened/tilted window:

As soon as the window contact detects an opened window, the blinds shall be moved up to the value 0 f $90 \%$. Of course this function shall only be administrated if the blinds are in the bottom end stop. So you choose at the parameter "Action at value $=0$ " the setting "Drive to position if position is down". When the window is closed again, the blinds shall drive again to the bottom end position. So you choose at "Action at value $=0$ " the setting "move down".

- The shading shall only drive if the blinds are up:

If the blinds are stilled closed in a room, e.g. the bedroom, or already manually driven to certain shading position and shall not drive to the adjusted shading position, the position start up via 1 Bit object can fix this problem. The parameter "Action at value = 1" must be selected as "Drive to position if blinds are up". The deactivation can be selected as "move up". To note is, that this function will only be done if the blinds are not moved to another position before.

### 6.5 Scenes

If functions of different crafts (e.g. light, shutter, heater) shall be controlled with only one keystroke or command, it will be useful to use the scene-function. By calling this scene, you are able to set the lights in a room to specific value or dim them, drive the shutter to a specific value and rotate the blinds, the control of the heater can be set to day operation and switch on the power supply of the sockets. The telegrams of this function can have different formats as well as different values with various meaning (e.g. " 0 " for lights off and open shutters). Without the scene function you have to send every actor a separate signal to get the same setting.
By using the scene function of the shutter actor you can integrate the channels to a scene control. In order to do this you have to allocate the respective memory (scene (A-H) a value. There are up to 8 scenes for every channel possible. If the scene function is activated for this channel the according scene menu is shown. At this menu the single scenes can be activated and values, scene numbers and the memory function on/off can be set.
Scenes get activated by reception of their scene number at the according scene object. If the memory function is activated at the scene, the saving will follow with the actual values of the channels. The communication objects have always the size of 1 Byte.

The following illustration shows the possible settings at the ETS-Software to activate the scenes:

Figure 43: Scene function

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 16 | Scene | 1 Byte | Call of the respectively scene |

Table 70: Communication object scene

To call a specific scene, you have to send the value of the respectively scene to the communication object for the scene function. The value, to call the scene, is thereby always one number less than the adjusted scene number. If you for example want to call scene number 1 , you have to send a 0 . Consequently the scene number can have the values from 1 to 64 , but the values to call a scene only from 0 to 63.
If you activate the call of a scene at a binary input, you have to set the same scene numbers at your binary input and at your shutter actor. The binary input sends automatically the right value to call the scene.

### 6.5.1 Submenu scene

Every channel has 8 opportunities to save scenes. This 8 memory cells have the names A-H. Every of the 8 scenes can get one of the possible 64 scene numbers. The following illustration shows the setting options at the sub item scene (channel $X$ : scene) for the scenes A-D and a channel, which was selected as shutter (scenes E-H are the same as the first four):

Figure 44: Submenu scene

The subitem for blinds is almost the same like the one for a shutter channel, but the setting options for position of blinds are dropped out.

The following chart shows the dynamic range for the scenes:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Save scenes | not active <br> active | activates/deactivates the memory function <br> for scenes |
| Scene A - position | $0-100 \%$ <br> [0\%] | Adjustment for absolute positions when <br> calling the scenes |
| Scene A - position of blinds | [0\%] <br> $[100 \%$ | Adjustment for absolute blind positions <br> when calling the scene (only at channels, <br> which are chosen as shutter) |
| Scene number A |  | Scene number; pick-up value $=$ one number <br> less than the scene number <br> (default values increase by every <br> alphabetic increment, B=2; C=3,...) |

Table 71: Dynamic range scenes

If a scene is activated in a channel, a subitem scene for this channel will appear. At this subitem the channel can be allocated a reaction for the call of this scene. This reaction contains a command for an absolute height ( $0-100 \%$ ) for this channel or additional an absolute position of blinds at a shutter channel (see also Chart 17). Every channel can react to eight different scenes. By sending the according pick-up value for the scene, the scene is called and assumes its parameterized conditions. During this process the channel regards also its individual parameterization. If the channel shall for example drive to $0 \%$ by calling the scene and still drives down at $70 \%$, the pause at change of direction will be observed before the channel starts driving up to $0 \%$.
You have to observe at the programming, that if two or more channels shall refer to the same scene numbers, the communication objects are hosted in the same group address. By sending the pick-up value for the scene, all channels with the according scene number respond. It is useful to divide your group addresses after scenes to make the programming more clearly. That means if a channel shall react to eight different scenes, the communication object is also integrated in eight different group addresses.

For calling a scene or saving a new value for the scene, you have to send the accordingly code to the relevant communication object for the scene:

| Scene | Retrieve |  | Save |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Hex. | Dez. | Hex. | Dez. |
| 1 | 0x00 | 0 | 0x80 | 128 |
| 2 | $0 \times 01$ | 1 | 0x81 | 129 |
| 3 | $0 \times 02$ | 2 | 0x82 | 130 |
| 4 | $0 \times 03$ | 3 | 0x83 | 131 |
| 5 | $0 \times 04$ | 4 | 0x84 | 132 |
| 6 | $0 \times 05$ | 5 | $0 \times 85$ | 133 |
| 7 | $0 \times 06$ | 6 | 0x86 | 134 |
| 8 | $0 \times 07$ | 7 | 0x87 | 135 |
| 9 | $0 \times 08$ | 8 | 0x88 | 136 |
| 10 | $0 \times 09$ | 9 | 0x89 | 137 |
| 11 | $0 \times 0 \mathrm{~A}$ | 10 | 0x8A | 138 |
| 12 | 0xOB | 11 | 0x8B | 139 |
| 13 | 0xOC | 12 | 0x8C | 140 |
| 14 | 0x0D | 13 | 0x8D | 141 |
| 15 | OxOE | 14 | 0x8E | 142 |
| 16 | 0x0F | 15 | 0x8F | 143 |
| 17 | $0 \times 10$ | 16 | $0 \times 90$ | 144 |
| 18 | $0 \times 11$ | 17 | $0 \times 91$ | 145 |
| 19 | $0 \times 12$ | 18 | $0 \times 92$ | 146 |
| 20 | $0 \times 13$ | 19 | $0 \times 93$ | 147 |
| 21 | 0x14 | 20 | 0x94 | 148 |
| 22 | 0x15 | 21 | 0x95 | 149 |
| 23 | $0 \times 16$ | 22 | $0 \times 96$ | 150 |
| 24 | $0 \times 17$ | 23 | $0 \times 97$ | 151 |
| 25 | $0 \times 18$ | 24 | $0 \times 98$ | 152 |
| 26 | 0x19 | 25 | $0 \times 99$ | 153 |
| 27 | 0x1A | 26 | 0x9A | 154 |
| 28 | 0x1B | 27 | 0x9B | 155 |
| 29 | 0x1C | 28 | 0x9C | 156 |
| 30 | 0x1D | 29 | $0 \times 9 \mathrm{D}$ | 157 |
| 31 | 0x1E | 30 | 0x9E | 158 |
| 32 | 0x1F | 31 | 0x9F | 159 |

Table 72: Calling and saving scenes

### 6.6 Automatic function

You can activate an automatic function for every channel. Through the automatic function, you can call up to 4 different conditions. The automatic function is divided into two different blocks ( $A$ and $B$ ). It is also possible to call several moves to the same time through the automatic function, for example drive the blinds as well as the shutter and change the opening angle of the blinds. The following Illustration shows the activation of the automatic function for a channel:

Figure 45: Automatic function

If the automatic function is activated for a channel, at the left drop down menu a new subitem (channel X: Automatic) will appear to parameterize the automatic function for this channel.

### 6.6.1 Submenu automatic function

The following illustration shows the setting options for an automatic function at the subitem channel X: automatic:

|  | Channel A: Automatic |
| :--- | :--- |
| Automatic objects | Block A |
| Automatic function 1-Position | $100 \%$ |
| Automatic function 1-position of blinds | $100 \%$ |
| Automatic function 2 - Position | $50 \%$ |
| Automatic function 2 -position of blinds | $25 \%$ |
| Automatic function 3 - Position | $75 \%$ |
| Automatic function 3-position of blinds | $0 \%$ |
| Automatic function 4-Position | $30 \%$ |
| Automatic function 4 -position of blinds |  |

Figure 46: Submenu automatic function

The following chart shows the dynamic range for the first automatic function. There are 4 different automatic functions for every channel. The dynamic range of the automatic functions 2,3 and 4 are the same as the first.

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Automatic function 1(-4) - <br> Position | $0-100 \%$ | height position for the first automatic <br> function |
| Automatic function 1(-4) - | $0-100 \%$ | position of blinds for the first |
| position of blinds | [0\%] | automatic function(only at shutters) |

Table 73: Dynamic range automatic function

At the subitem for the automatic function, you can depose values for 4 different automatic calls. The values are absolute values, which the channel accepts at the call of the according automatic function. Additional you can determine for every channel to which automatic block the channel shall refer. Here are the blocks $A$ and $B$ disposal. The activation of the blocks is descripted below.

Additional an option for the automatic function can be parameterized:

Figure 47: Option for automatic

At the "option for automatic" the area of validity of the automatic function for one channel can be restricted. So e.g. the channel B can react only to one certain position or perform the call of an automatic function only if the shutter/blinds are in an end position.
Furthermore a moving command can be parameterized for the deactivation of the automatic function. But this moving command is only performed if the channel is still in the called position. For proofing this, an internal alignment between the current position and the called position is done before moving the channel. So it is ensured that the action at return of the automatic function is only performed if the shutter/blinds are not driven manually to any certain value.

The following settings are available for the automatic position:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Option for automatic | - not active <br> - active | Activation of the automatic option |
| Channel react on | - Automatic position 1-4 <br> - Automatic position 1 <br> - Automatic position 2 <br> - Automatic position 3 <br> - Automatic position 4 | Adjustment which automatic positions shall be performed of the channel |
| Startup automatic position (value = 1) | - ever <br> - if position = UP <br> - if position = DOWN | Adjustment if the automatic position shall only be performed in an end position |
| Action at reset of automatic position (value=1) | - not active <br> - move up <br> - move down | Adjustment, which action the channel shall perform at the reset of the automatic function |

Table 74: Option for automatic

Individual shading and air ventilation projects can be realized by the option for the automatic function.

The communication objects are shown at the following chart:

| Number | Name | Length | Usage | Number |
| :--- | :--- | :--- | :--- | :--- |
| 125 | automatic | automatic position 1 | 1 Bit | Call of the first automatic position at block A |
| 126 | automatic | automatic position 2 | 1 Bit | Call of the second automatic position at block A |
| 127 | automatic | automatic position 3 | 1 Bit | Call of the first automatic position at block B |
| 128 | automatic | automatic position 4 | 1 Bit | Call of the second automatic position at block B |

Table 75: Communication objects automatic function

The communication objects, with the size of 1 Bit , can be allocated arbitrary to the group addresses. By calling one of the communication objects, the deposited values for the automatic function are called. It is possible to move all channels of one shutter actuator to their parameterized values with only one command, but also to move only one channel. This happens in according to the parameterization, which was made for the individual channel at the subitem automatic function. To move more channels to the same time to a specific value, you have to choose the same blocks for these channels and set the same values for this automatic positions.

### 6.7 Alarm functions/ superior functions

The shutter actuator can react to specific weather situations and introduce several reactions for this channel to protect the shutters/blinds by using the alarm function. Additional reactions on a bus power breakdown or a bus power return can be defined. The alarm functions can be activated or deactivated for every several channel.
The signals for the alarms can be recovered of a KNX weather station. Now the shutter actuator is able to evaluate these signals and assemble them according to the parameterization.
The following Illustration shows the activation of the alert functions for a channel:

Figure 48: Alarm functions

If the alarm function is activated for a channel, at the left drop-down menu appears a subitem (channel X: Alarms), in which the following parameterization can ensue.

If the alarm function is activated, you can make the following parameterization at the appeared subitem.
The following illustration shows the drop-down menu for the alert function:

| Channel A: Alarm and block functions |  |
| :---: | :---: |
| Order of alarms | Wind, Rain, Frost, Block |
| Action at reset of alarms / block | no action |
| Action at blocking (value $=1$ ) | no action - |
| Extended block function | not activ $\quad$ - |
| Wind alarm | not activ $\quad$ - |
| Rain alarm | not activ |
| Frost alarm | not activ |
| Reaction when bus power down | no action $\quad$ - |
| Reaction when bus power up | no action |

Figure 49: Subitem alert function

The several parameters of the alert function, as well as the setting options, are descripted in detail at the following segments.

### 6.7.1 Order of alarms

The parameter "order of alarms" describes the priority of the several alarms.
The following chart shows the setting options for this parameter:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :---: | :--- |
| Order of alarms | - Wind, Rain, Frost, Block | sets the priority of the |
|  | - Wind, Rain, Block, Frost | alarms |
|  | - Wind, Block, Rain, Frost |  |

Table 76: Order of alarms

If there are two or more alarms activate to the same time, the shutter actuator will evaluate the alarms according to the appointed order of alarms. The shutter actuator implements only the function of the alarm with the highest priority. The function for the alarm with the lower priority does not implement, as far the alarm with the higher priority is active. When the alarm with the higher priority is deactivated and the alarm with the lower priority is still active, the function for the alarm with the lower priority is activated afterwards.

### 6.7.2 Alarm types

Three different types of alarms can be activated (wind alarm, rain alarm, frost alarm), which can be set individually afterwards.
The following chart shows the dynamic range of the three types of alarms:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Wind alarm | - not active <br> - active | Activation of the wind alarm |
| Cycle time (only when wind alarm is activated) | $\begin{aligned} & 0-120 \mathrm{~min} \\ & \text { [30min] } \end{aligned}$ | periodic observation of the wind alarm setting 0 deactivates the periodic observation |
| Action (only when wind alarm is activated) | - no action <br> - drive to top <br> - drive to bottom | Action when wind alarm gets active |
| Rain alarm | - not active <br> - active | Activation of the wind alarm |
| Cycle time (only when rain alarm is activated) | $\begin{gathered} 0-120 \mathrm{~min} \\ \text { [30min] } \end{gathered}$ | periodic observation of the rain alarm setting 0 deactivates the periodic observation |
| Action (only when rain alarm is activated) | - no action <br> - drive to top <br> - drive to bottom | Action when rain alarm gets active |
| Frost alarm | - not active <br> - active | Activation of the wind alarm |
| Cycle time (only when frost alarm is activated) | $\begin{gathered} 0-120 \mathrm{~min} \\ \text { [30min] } \end{gathered}$ | periodic observation of the frost alarm setting 0 deactivates the periodic observation |
| Action (only when frost alarm is activated) | - no action <br> - drive to top <br> - drive to bottom | Action when frost alarm gets active |

Table 77: Alarm types

If an alarm is activated the according communication object appears. If the according communication object receives an " 1 -signal", the alarm function will be activated. By sending a " 0 -signal", the alarm gets deactivated.
The following chart shows the according communication objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 101 | Wind alarm | 1 Bit | Activation/deactivation of the wind alarm |
| 102 | Rain alarm | 1 Bit | Activation/deactivation of the rain alarm |
| 103 | Frost alarm | 1 Bit | Activation/deactivation of the frost alarm |

[^9]The function of the alarms is identical for every of the three alarm types. For every of the three alarms a periodic observation can be activated (have a look at 4.8.3). Furthermore an action for the release of each alarm can be set. Here, the user has 3 opportunities: On the one hand the shutter actuator can drive the channel to the top or to the bottom, when the alarm is activated. On the other hand the shutter actuator can react with the setting "no action". At this setting, the channel stays in its actual position. A movement of this channel is not possible as long as the alarm is activated. Also after the reset of the alarms, the shutter actuator can perform predetermined functions. These are descripted at 4.8.5.
Please note, that the communication objects of the alarms shall always be connected to group addresses; otherwise there is no opportunity to receipt the alarms. If an alarm is activated because of its periodic observation, which is not connected to a group address, you will only be able to receipt it by using the ETS-Software!

### 6.7.3 Periodic observation

The periodic observation of the alarm function can be activated for every of the three alarms separately. The dynamic range extends from 0 to 120 min , whereby the setting 0 min sets the periodic observation off.
The communication object for the respectively alarm must get a signal during the parameterized time, otherwise the alarm causes automatically. There are settings at KNX weather stations, in which clearances the periodic sending shall follow. The time for the periodic sending shall be always set less than the observation time to avoid an unwittingly cause of the alarm.
You can get sure that a weather sensor works properly, by using the periodic observation. If a signal is absent, because of a failure of the weather station or a wire break, the shutter actuator will trigger the alarm after the expiration of the observation time.
The following illustration shows the setting options for the periodic observation:

| Cycle Time (min, $0=\mathrm{off})$ | $\boxed{30}$ | $[0.120]$ |
| :--- | :--- | :--- |

Table 79: Periodic observation

### 6.7.4 Normal blocking

The following chart shows the dynamic range for the activation of the blocking object:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| Action at blocking (Value=1) | - no action <br> - <br> $\quad$Drive to top <br> Drive to bottom | Adjustment for the activation of <br> the blocking object of the channel |

Table 80: Action at blocking
The shutter actuator can drive to predefined positions, top or bottom, at the activation of the blocking object or stay in its current position. At an activated block function, no driving of the channel is possible.
The following chart shows the relevant communication object:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 104 | Block | 1 Bit | Activation/Deactivation of the normal blocking function |

Table 81: Communication object Block

### 6.7.5 Action at reset of alarms and blocks

For every channel an action at the reset of the alarm and all blocking functions can be parameterized. This parameter operates to all alarms and blocking functions of the selected channel. The dynamic range of this parameter is shown at the following chart:

| ETS-text | Dynamic range <br> [default value] | comment |
| :--- | :--- | :--- |
| Action at reset of | - no action <br> alarms/block | drive to former position <br> - drive to top |
| - drive to bottom |  |  |$\quad$| Adjustment for the repeal of the |
| :--- |
| alarm and blocking functions |

Table 82: Action at reset of alarms

The user has 4 different setting options for the parameter "Action at reset of the alarms/block", which the shutter actuator can conduct for this channel.
By using the setting "no action" the channel stays in its position, which he had during the active alarm/block.
The setting "drive to former position" let the shutter actuator drive the channel to the position, which it had before the alarm/block was activated. If you chose "no action" for the action of an activated channel, this setting will have no effect to the position of this channel.
Furthermore the shutter actuator can drive the channel to the top or the bottom at the reset of an alarm/block.
The setting "Action at reset of alarms/block" is always valid for the complete channel, even if you have chosen three different settings for the three possible alarms and blocks.

### 6.8 Block functions

The extended block function can be activated for every channel by a separately subitem. When the extended block function was activated for a channel, a new subitem appears, under the according channel, called channel X: Extended block function at the drop down menu.
The following illustration shows the activation of the block function:

Figure 50: Activation block function

The following illustration shows the distribution at the submenu of the block function:

|  | Channel A: Extended block function |
| :--- | :--- |
| Object "Block absolute position" | activ |
| Block of absolut position via object "Blinds Up/Down" | not activ |
| Settings for object "Block universal mode" |  |
| The object blocking the following functions: |  |
| Block manual control | not activ |
| Block Up/Down movement | not activ |
| Block absolute position mode | not activ |
| Block automatic mode |  |
| nlock scene mode activ |  |

Figure 51: Block function

The following chart shows the dynamic range, which can be set at the submenu of the block function:

| ETS-text | Dynamic range <br> [default value] | comment |
| :---: | :---: | :---: |
| Action at blocking (Value=1) | - no action <br> - drive to top <br> - drive to bottom | Reaction to the activation of a blocking instance |
| Block of absolute position via Objects "Blinds Up/Down" | - not active <br> - active | activates the driving to absolute positions by manual driving |
| Settings for object "Block universal mode" | - not active <br> - active | activates the communication object and the setting options for the universal blocking mode |
| The object blocks the following functions: |  |  |
| Block manual control | - not active <br> - active | with activation of the object "block universal mode" the manual control gets blocked |
| Block up/down movement | - not active <br> - active | with activation of the object "block universal mode" the up/down movement gets blocked |
| Block absolute position mode | - not active <br> - active | with activation of the object "block universal mode" the absolute position mode gets blocked |
| Block automatic mode | - not active <br> - active | with activation of the object "block universal mode" the automatic objects for this channel gets blocked |
| Block scene mode | - not active <br> - active | with activation of the object "block universal mode" the scen calling for this channel gets blocked |

Table 83: Block functions

When the particular block functions are activated the according communication objects appears. The chart shows the according communication objects:

| Number | Name | Length | Usage |
| :--- | :--- | :--- | :--- |
| 99 | block absolute position | 1 Bit | blocks the object absolute position |
| 100 | block universal mode | 1 Bit | blocks the channel according to the appointed <br> parameterization |

Table 84: Communication objects block function

It is possible to block the absolute position commands with the parameter "block absolute position". By activation the according object the channel can no longer receive commands for an absolute height until the object is deactivated by a"0". The sub function "Block of absolute position via Objects Blinds Up/Down" allows blocking the driving to absolute position as soon as manual driving is activated. This function has its areas of application when a weather station activates a sun protection, but the user wants to drive the shutter/blinds manual to any other value. By driving manual, the shutter actuator is blocked for receiving absolute positions for sun protection and can be driven normal.
It is possible to configure the blocking process on your own by using the parameter "Blocking universal mode". Therefore 5 different options are available:

- Block manual control
$>$ blocks the manual control at the device for this channel
- Block up/down movement
$>$ blocks the driving commands of the channel (also the blind adjustment at shutters)
- Block absolute position mode
$>$ blocks the receiving of absolute position commands via the object "absolute position"
- Block automatic mode
$>$ blocks the automatic function for this channel, that means the call of the channel via the automatic function is blocked for this channel
- Block scene mode
$>$ blocks the scene mode for this channel, that means at a scene calling, in which the blocked channel is integrated, the channel is not called with and stays instead in its actual position

All blocking function can be activated by a logical " 1 " and deactivated by a logical " 0 ".

## 8 Attachment

### 8.1 Statutory requirements

The above-described devices must not be used with devices, which serve directly or indirectly the purpose of human, health- or lifesaving. Further the devices must not be used if their usage can occur danger for humans, animals or material assets.
Do not let the packaging lying around careless, plastic foil/ -bags etc. can be a dangerous toy for kids.

### 8.2 Routine disposal

Do not throw the waste equipment in the household rubbish. The device contains electrical devices, which must be disposed as electronic scrap. The casing contains of recyclable synthetic material.

### 8.3 Assemblage

## Risk for life of electrical power!

All activities on the device should only be done by an electrical specialist. The county specific regulations and the applicable EIB-directives have to be observed.
technologies
MDT KNX RF+ Glass Push Button 2/4/6/8-fold Plus with Actuator, flush mounted

| Version |  |  |
| :--- | :--- | :--- |
| RF-GTA4W.01 | KNX RF+ Glass Push Button 4-fold Plus | Flush mounted with Actuator, White, Surrounding orientation light |
| RF-GTA4S.01 | KNX RF+ Glass Push Button 4-fold Plus | Flush mounted with Actuator, Black, Surrounding orientation light |
| RF-GTA8W.01 | KNX RF+ Glass Push Button 8-fold Plus | Flush mounted with Actuator, White, Surrounding orientation light |
| RF-GTA8S.01 | KNX RF+ Glass Push Button 8-fold Plus | Flush mounted with Actuator, Black, Surrounding orientation light |

The MDT KNX RF+ Glass Push Buttons release KNX telegrams after touching the sensor areas top, 1 or 2 Button operation can be paramerized. The device provides extensive functions like switching of lighting, operation of blinds and shutters, contact type and block communication objects for each channel. The Glass Push Button has 4 integrated logic modules. The sending of an second object is possible by the logical modules.

Furthermore the MDT Glass Push Button has an integrated cleaning function and an additional switching channel that operates if 3 or more of the sensor area were touched (e.g. panic function).

The MDT KNX RF+ Glass Push Button is operating in bidirectional KNX RF+ system mode and is perfectly suited to replace conventionel push buttons in existing installations without placing KNX bus cables. The connections to the KNX bus is realized via the MDT KNX RF+ Line Coupler. The integrated actuator can be set as 2-fold switching actuator or 1-fold shutter actuator (RF-GTA8x. 01 4-fold/2-fold).

For individually marking of the MDT KNX RF+ Glass Push Button you can insert a labeling film behind the glas front. The labeling film for laser printers is included in delivery. You find the marking draft in our download area.

The MDT KNX RF+ Glass Push Buttons have a surrounding orientation light LED and a bicolored (White/Red) LED for sensor area. These LED can be set from internal or external objects, the brightness of the LED is adjustable in 5 steps (Day and night can be set independent). The LED can display 3 situations like: LED off 0 „absent", LED white „present", LED red „window open".

The MDT KNX RF+ Glass Push Button is a flush mounted device (RF-GTA4x.01: 1 outlet socket, RF-GTA8x.01: 2 outlet sockets with centre-to-centre gauge 71 mm ) for fixed installations in dry rooms, it is delivered with support ring.

For project design and commissioning of the MDT KNX RF+ Glass Push Button it is recommended to use the ETS. Please download the application software at www.mdt.de/Downloads.html

- Production in Germany, certified according to ISO 9001
- New KNX RF+ protocol in system mode
- Commissioning with ETS 5
- Sensor areas can be adjusted for 1 or 2 button operation
- NO or NC contact operation, adjustable length of button push
- Forced setting function for each output
- Operation with short/long button push and 2 objects
- Operation of blinds and shutters, 1 and 2 button operation
- Can be set as 2-fold switching actuator or 1-fold shutter actuator
- Connection via MDT KNX RF+ line coupler
- Surrounding orientation light with day/night object
- Title block to insert behind glass front, labeling film included
- To upgrade your installation without placing KNX bus cables
- Power supply 230VAC
- Installation with support ring (included in delivery)
- 3 years warranty

| Technical Data | RF-GTA4W. 01 RF-GTA4S. 01 | RF-GTA8W. 01 <br> RF-GTA8S. 01 |

| Required outlet sockets for installation | 1 | $2^{* *}$ |

Examplary circuit diagram RF-GTA4x. 01

* Depends on the switching position of the output relays.
** The center-to-center gauge of the outlet sockets has to be 71 mm . Bus connection terminal is in lower socket.
*** Insulation of the inserted cable must be removed 8 mm .

## EU Declaration of Confirmity Socket RF+

Hereby, MDT technologies GmbH declares that the radio equipment type radio RF-GTxxx. 01 is in compliance with directive 2014/53/EU. The full text of the EU declaration of confirmity is available at the following internet address: www.mdt.de/download/MDT_CE_RFGTA.pdf
